3. In *anat. and zool.*, the bony cavity of the skull which contains the eye; the eye-socket. In man the orbits are a pair of quadrilateral pyramidal cavities completely surrounded by bone, and separated from each other by communicating with the cranial cavity and the nasal and temporal fossae, and opening forward upon the face, with the apex at the optic foramen where the optic nerve enters. Seven bones enter into the formation of each orbit, the frontal, sphenoid, ethmoid, maxillary, palatal, lacrymal, and malar, of which the first-named three are common to both orbits. Each orbit communicates with surrounding cavities by several openings, the principal of which are—with the cranial cavity by the optic foramen and sphenoidal fissure; with the nasal fossae by the lacrymal canal; with the temporal and zygomatic fossae by the sphenomaxillary fissure; with ethmoidal parts by the anterior and posterior ethmoidal foramina; and with the face by supra-orbital, infra-orbital, extra-orbital, and malar foramina. The orbit contains the eye and its associate muscular, vascular, glandular, sustentacular, mucous, and nervous structures.

In Greek theaters this space was circular, and was allotted to the chorus, which performed its evolutions about the thymele or altar of Dionysus, which occupied the center of the orchestra. Among the Romans the orchestra corresponded nearly to the orchestra of modern play-houses, and was set apart for the seats of senators and other persons of distinction. See diagram under *diazoma*. 2. In *mod. music*, a company of performers on such instruments as are used in concerted music; a band. (In the United States *band* usually signifies a military band; but in England *band* is interchangeable with *orchestra*.) The historic development of the orchestra as now known did not begin until about 1600, when the independent value of instrumental music was first generally accepted. Up to that time, though many instruments had been known and used, both alone and as supports for vocal music, they had not been systematically combined, nor had concerted music been written for them. The process of experiment, selection, and improvement in construction and mutual adaptation went on steadily until nearly 1800, when the orchestra first arrived at its present proportions. The instruments now used consist of four main groups: (a) the *strings*, including violins (first and second), violas, violoncellos, and bass viols, these together constituting the largest and decidedly the most important group, which is often used entirely alone, and is then called the *string-orchestra*; (b) the *wood wind*, including flutes, oboes, clarinets, English horns, basset-horns, bassoons, etc., these all being used both to enrich the effect of the strings, and in alternation with them to afford contrasts in tone-quality; (c) the *brass wind*, including French horns, trumpets, cornets, trombones, ophicleides, etc., these being also used both in conjunction and in contrast with the other groups, though their decidedly greater sonority makes their introduction necessarily more rare; and (d) the *percussives*, including tympani, snare and bass drums, cymbals, bells and triangles, harps, etc., and also sometimes the piano-forte, though the latter is seldom ranked as a true orchestral instrument. The proportions of the several groups are varied somewhat both by composers and by conductors. A *full orchestra* is one in which all these groups are present in fairly complete form; a *small orchestra* is one in which some important instruments are lacking. All the above instruments, except the harp, are essentially monophonic, and the peculiar artistic importance of the orchestra is based upon the fact that every element in the total effect is produced by a solo instrument in the hands of a separate performer. The orchestra is extensively employed both in accompanying vocal music of every kind and in purely instrumental works. Its unlimited capacities for varied effect have led to the production of an extensive musical literature, in which are some of the most famous specimens of musical art. The orchestra is an indispensable factor in all extended works like operas and oratorios. The maintenance of orchestras was originally undertaken by individual princes in the several European states; but they are now either attached to opera-houses or supported by the proceeds of popular concerts.

theil*, *urteil*, a judgment, decision), < *or-*, ac-
cented form of *ur-*, usually *ā-* (see *a*-1), + *dāl*,
däl, a part, deal (or rather the base of the orig.
verb), with a suffix lost in AS., but retained in
OS. and OHG.: see *or-* and *deal*]. The techni-
cal use of the word, the disappearance of *or-* as
a significant prefix, and the remoteness of the
main element *-deal* from its etym. mean-
ing, led to a separation of the word from its
actual source, and its treatment as of L. origi-
n; hence the ordinary pron. in three sylla-
bles (as if the termination were like that of *real*,
ideal, etc.), instead of the orig. two (ôr'dēl.)

I, n. 1. A form of trial to determine guilt or
innocence, formerly practised in Europe, and
still in parts of the East and by various savage
tribes. It consisted in testing the effect of fire, water,
poison, etc., upon the accused. Well-known fire-ordeals
in England were the handling of red-hot irons, or the walk-
ing over heated plowshares. A common form of the wa-
ter-ordeal was the casting of the accused into water: he
was considered innocent if he sank, guilty if he floated.
The practice of "ducking witches" is a survival of this
water-ordeal, and the phrase "to go through fire and
water" probably alludes to those customs. These ordeals
were abolished in England in the reign of Henry III., but
the wager of battle remained. The ordeal of poison-water
is common in Africa; that of burning candles, in Burma;
that of eating rice, in Siam, etc.

By *ordal* or by oath,

3. Specifically—(a) The degree, rank, or sta-
tus of clergymen.

And the title that ze take *ordres* by telleth ze ben

Piers Plowman (B), xi. 281.

(b) One of the several degrees or grades of the
clerical office. In the Roman Catholic Church these
orders are bishop, priest (presbyter), deacon, subdeacon,
acolyte, exorcist, reader, and doorkeeper. Originally the
first three were accounted *major orders* and the others
minor orders. Since the twelfth century the order of sub-
deacon has been advanced to the rank of a major order, and
the number of orders is generally counted as seven, the or-
ders of bishop and presbyter being regarded as one order
in so far as the sacerdotal character belongs to both. In
the Orthodox Greek and other Oriental churches the major
orders are those of bishop, priest, and deacon, and the
minor orders are subdeacon, reader (anagnost), and some-
times singer (psalter). The orders of bishop, priest, and
deacon are known not only as *major* or *holy orders*, but as
apostolic orders. The orders of subdeacon, acolyte, exorcist,
and doorkeeper (ostiar) existed in the Western Church
before the middle of the third century; those of subdeacon,
exorcist, reader, singer, and doorkeeper were as old as the
third or fourth century in the Eastern Church. The Angli-
can Church retains only the orders of bishop, priest, and
deacon. Major orders can be conferred by bishops only.
Chorispiscopi, abbots, and priests have sometimes, how-
ever, been authorized to confer minor orders.

They cannot abide
Vnto Church *ordres* stricte to be tide.
Tines' Whistle (E. E. T. S.), p. 14.

(c) In the Roman Catholic, Greek, Anglican,
and other episcopal churches, the sacrament
or rite of ordination, by which ecclesiastics re-
ceive the power and grace for the discharge
of their several functions: specifically termed *holy
order*, or more commonly *holy orders*. The bishop
alone can administer this rite. Orders as a sacrament or
sacramental rite are limited to the major orders.

He [a certain friar] went to Amiens to be fully confirmed

With loyal blazon, evermore be blest!

These were the prime in *order* and in might.
Milton, P. L., i. 506.

5. (a) In *zool.*, that taxonomic group which
regularly comes next below the class and next
above the family, consisting of one or more
families, and forming a division (sometimes the
whole) of a class. Like other classificatory groups, it
has only an arbitrary or conventional taxonomic value.
Compare *superorder*, *suborder*. (b) In *bot.*, the most
important unit of classification above the ge-
nus, corresponding somewhat closely to *family*
in zoölogy. See *family*, 6. In phanerogams the
term *family* is not technical or systematic, being some-
times applied to suborders, tribes, or even genera. In
cryptogams it is made a subdivision of the order by some
authors. See *natural order*, under *natural*.

6. A number of persons of the same profes-
sion, occupation, or pursuits, constituting a
separate class in the community, or united by
some special interest.

Specifically—(a) A body or society of persons living by
common consent under the same religious, moral, or social
regulations; especially, a monastic society or fraternity:

One of our *order*, to associate me,

Shak., R. and J., v. 2. 6.

As a broad general rule, nearly every post-Reformation institute is styled not an *Order* but a "Congregation"; but the only distinction which can be drawn between these two names is that *order* is the wider, and may include several congregations within itself (as the Benedictine *order*, for example, includes the congregations of Cluny and of St. Maur), while a "congregation" is a simple unit, complete in itself, and neither dependent on another institute nor possessed of dependent varieties of its own.

Encyc. Brit., XVI. 715.

(b) An institution, partly imitated from the medieval and crusading orders of military monks, but generally founded by a sovereign, a national legislature, or a prince of high rank, for the purpose of rewarding meritorious service by the conferring of a dignity. Most honorary orders consist of several classes, known as *knights companions, officers, commanders, grand officers, and grand commanders*, otherwise called *grand cross or grand cordon*. Many orders have fewer classes, a few having only one. It is customary to divide honorary orders into three ranks: (1) Those which admit only nobles of the highest rank, and among foreigners only sovereign princes or members of reigning families; of this character are the Golden Fleece (Austria and Spain), the Elephant (Denmark), and the Garter (Great Britain); it is usual to regard these three as the existing orders of highest dignity. (2) Those orders which are conferred upon members of noble families only, and sometimes because of the mere fact of noble birth, without special services. (3) The orders of merit, which are supposed to be conferred for services only. Of these the Legion of Honor is the best-known type. Two of the orders of merit may be regarded as somewhat exceptional—the first class of the Order of St. George of Russia and the Order of Maria Theresa of Austria. The former is conferred only upon a commanding general who has defeated an army of 50,000 men, or captured the enemy's capital, or brought about an honorable peace. There is now no person living who has gained this distinction regularly, though it has been given to a foreign sovereign. Other orders of merit approach these more or less nearly, as they are conferred with more or less care. The various orders have their appropriate insignia, consisting usually of a collar of design peculiar to the order, a star, cross, jewel, badge, ribbon, or the like. It is common to speak of an order by its name alone, as the Garter, the Bath. An order is said to be *conferred* or *bestowed* upon the recipient of its distinction; the recipient is said to be *decorated* with such an order; and the word *order* is often applied to the decoration or badge. See *bath, garter, knighthood, star, thistle, etc.*

10. In *rhet.*, the placing of words and members in a sentence in such a manner as to contribute to force and beauty of expression, or to the clear illustration of the subject.—11. In *classical arch.*, a column entire (including base, shaft, and capital), with a superincumbent entablature, viewed as forming an architectural whole or the characteristic element of a style. There are five orders—Doric, Ionic, Corinthian, Tuscan, and Composite. (See these adjectives.) Every order consists of two essential parts, a column and an entablature; the column is normally divided into three parts—base, shaft, and

capital; the entablature into three parts also—architrave, frieze, and cornice. The character of an order is displayed not only in its column, but in its general form and details, of which the column is, as it were, the regulator. The Tuscan and Composite are the Roman orders, the other three are properly Greek, the Roman renderings of them being so different from the originals as to constitute in fact distinct orders. The Corinthian, though of purely Greek origin, did not come into extensive use before Roman authority was established throughout Greek lands.

The temple on the side of the river seems to be of the greatest antiquity, and was probably built before the orders were invented.

Pococke, Description of the East, II. 1. 135.

12. In *math.*: (a) In geometry, the degree of a geometrical form considered as a locus of points, or as determined by the degree of a locus of points. Newton introduced the term *order* as applied to plane curves. Cayley defines the *order of a relation* in *n*-dimensional space as follows: add to the conditions as many arbitrary linear conditions as are necessary to make the multiplicity of the relation equal to *m*; then the number of points satisfying these conditions is the order of the relation. Thus, the *order of a plane curve* is the number of points (real and imaginary) in which this curve is cut by an arbitrary right line. The *order of a non-plane curve* is the number of points in which the curve is cut by a plane. The *order of a surface* is the number of points in which the surface is cut by a right line. Hence some writers call only that part of the mass which precedes the canon the *ordinary* or *ordo*.

The ordinaries are the oldest bearings, and in general the oldest escutcheons are those which are charged only with the ordinaries, or with these primarily, other charges having been added. The bearings most generally admitted as ordinaries are the eight following: bar, bend, chevron, chief, cross, fesse, pale, and saltire; but most writers add one, some two, and others a greater number, namely one or more of the following: bend sinister, inescutcheon, quarter or franc-quarter, pile, hordure. 2. The act of admitting to holy orders, or to the Christian ministry; the rite of conferring holy orders or investing with ministerial or sacerdotal power and authority. In episcopal churches, including the Roman Catholic Church, the Greek and other Oriental churches, and the Anglican Church, ordination consists in imposition of hands by a bishop upon the candidate, thus admitting him to one of the holy orders, and conferring on him the powers of that order and authority to perform its functions. The act of elevation to the episcopate is in strict technical use called *consecration*, not *ordination*. *Ordination* in its wider sense includes admission to the minor orders, which are usually conferred in the Roman Catholic Church by a bishop, but can be bestowed by an abbot, the act of admission consisting in the tradition (delivery) of the instruments. In Presbyterian churches the power of ordination rests with the presbytery, who appoint one or more of their number to conduct the ordination ceremonies, which include laying on of hands. In Congregational and Baptist churches ordination is customarily performed by the pastors of other churches (of the same denomination), but is regarded as necessary only for the preservation of church order; and the service is regarded as conferring no special religious authority. See *institution*, *induction*, *installation*.

As for *Ordination*, what is it but the laying on of hands, an outward signe or symbol of admission?

ordnance (ôr'd'nans), *n.* [An old form of *ordnance*: see *ordnance*, 5. Cf. *ordnance*.] Cannon or great guns collectively, including mortars and howitzers: artillery. As a technical term, it designates all heavy pieces fired from carriages. Modern ordnance may be divided into two classes, *smooth-bore* and *rifled*. The former are all muzzle-loaders; the latter are subdivided into *muzzle-loaders* and *breech-loaders*. Most guns of modern construction are breech-loading rifled arms. Classified according to the material used, cannon are *bronze*, *cast-iron*, *wrought-iron*, *steel*, or *mixed cast (wrought-iron and steel)* guns; according to the method of construction, they are called *solid* or *built-up* guns. The most modern type of heavy gun is an all-steel built-up breech-loading gun, with a Krupp or interrupted-screw ferreture. Formerly sometimes used in the plural.

Board of ordnance. (a†) Formerly, in Great Britain, a board, consisting of a master-general, surveyor-general, clerk, and storekeeper (usually members of Parliament), which provided the army and navy with guns, ammunition, and arms of every description, and superintended the providing of stores, equipment, etc. The Crimean disasters in 1854 showed the defects of this board, which was shortly afterward dissolved. (b) A board composed of United States ordnance-officers distinguished for their attainments in the theory and practice of heavy ordnance, its construction and use, whose duty it is to conduct experiments, and test and report upon all ordnance subjects referred to it by the chief of ordnance. This board is designated by the Secretary of War, and is advisory to the chief of ordnance of the army.—**Bureau of Ordnance.** See *Department of the Navy*, under *department*.—**Master of the ordnance.** See *master*.—**Ordnance corps.** Same as *ordnance department*.—**Ordnance department.** See *department*.—**Ordnance storekeeper.** See *storekeeper*.—**Ordnance stores,** a general phrase including everything pertaining to the manufacture, equipment, and service of ordnance or artillery. It comprises all projectiles and explosives, pyrotechnic stores, gun-carriages, caissons, limbers, mortar-beds, cavalry and artillery forges, battery-wagons, and all machines for mechanical manœuvres and for transportation, tools and materials for fabrication, repair, or preservation, all small-arms, accoutrements, and equipments for artillery, cavalry, and infantry. The phrase "ordnance and ordnance stores" covers everything in the form of a weapon that is used in war, together with all the materials and appliances necessary for their construction, repair, preservation, and use.—**Ordnance survey,** the survey of Great Britain, undertaken by the government, and executed by select corps of the Royal Engineers and civilians. The charts exhibit, in addition to the ordinary features of a map, the extent and limits of properties; and rivers, roads, houses, etc., are laid down on them in their just proportions, and not, as in ordinary maps, exaggerated. The scale adopted by the British government is, for towns having 4,000 or more inhabitants, $\frac{1}{62,500}$ of the linear measurement, which is equivalent to 26.72 inches to a mile, or 1 inch to 417 feet; for parishes (in cultivated districts), $\frac{1}{25,000}$ of the linear measurement, equal to 25.344 inches to a mile, or very nearly 1 square inch to an acre; for counties, 6 inches to a mile; for the kingdom, a general map, 1 inch to a mile. The purposes to which these large plans may be applied are as estate plans, for managing, draining, and otherwise improving land, for facilitating its transfer by registering sales and incumbrances, and as public maps, according to which local or general taxes may be levied and roads, railways, canals, and other public works laid out and executed.—**Rifled ordnance.** See *rifled cannon*, under *cannon*.

But in a history-piece of many figures, the general design, the *ordnanee* or disposition of it, the relation of one figure to another, the diversity of the posture, habits, shadowings, and all the other graces conspiring to an uniformity, are of . . . difficult performance.

Ordovician (ôr-dō-vish'ian), *a.* [Named from the *Ordovices*, an ancient British (North Welsh) tribe.] An epithet applied by C. Lapworth to a series of rocks not capable of exact separation from those underlying or overlying them, either stratigraphically or paleontologically, but which have been the subject of much discussion among English geologists. They form a part of the Lower Silurian of Murchison, more or less of the Upper Cambrian of Sedgwick, the Cambro-Silurian of Jukes, the Siluro-Cambrian of some authors, the second fauna of Barrande, etc. As limited in Wales, according to H. B. Woodward, the Ordovician may be said to extend from the base of the Arenig series to the base of the Llandovery. Graptolites and trilobites are the most abundant fossils, and there is a large amount of intercalated volcanic material. The name Ordovician does not appear in the text-book of geology recently issued by the director of the Geological Survey of Great Britain, nor has it any place in American Silurian geology as worked out by the New York and Pennsylvania surveys, nor can the strata thus named in England be strictly paralled with any one or more divisions of the Silurian as established in the United States.

A metalliferous mineral or rock, especially one which is of sufficient value to be mined. A mixture of a native metal with rock or veinstone is not usually called ore, however, it being understood that in an ore proper the metal is in a mineralized condition—that is, exists in combination with some mineralizer, as sulphur or oxygen. The ore and veinstone together constitute the mass of the metalliferous deposit, vein or lode. The ore as mined is usually more or less mixed with veinstone, and from this it is separated, as completely as may be convenient or possible, by dressing. It then usually goes to the smelter, who, by means of a more or less complicated series of operations, frees it from the worthless material which still remains mechanically mixed with it, and also sets it free from its chemical combination with the substances by which it is mineralized.**

2. Metal; sometimes, specifically, a precious metal, as gold.

2. A medium, instrument, or means of communication between one person or body of persons and another; a medium of conveying certain opinions: as, a secretary of state is the organ of communication between the government and a foreign power; an official gazette is the organ of a government; hence, specifically, a newspaper which serves as the mouthpiece of a particular party, faction, cause, denomination, or person: as, a Republican organ; a party organ.

5. In *phren.*, any part of the brain supposed to have a particular office or function in determining the character of the individual, and to be indicated by one of the areas of cerebral surface recognized by phrenologists: as, the organ of acquisitiveness, of alimenteriness, of inhabitiveness, etc.—6. The largest, the most complicated, and the noblest of musical instruments, consisting of one or many sets of pipes sounded by means of compressed air, the whole instrument being under the control of a single player; a pipe-organ, as distinguished from a reed-organ. Historically, the principle of sounding a pipe pneumatically has been known from the earliest times. The combination of pipes or whistles into graduated series, so as to produce the tones of some sort of scale, appears in the primitive Pan's-pipe and in the Chinese cheng, both of which are blown by the breath, the latter being perhaps

Section of a Two-manual Organ.

the actual prototype of the modern organ. Instruments of this general class seem to have been used in Europe from the first Christian centuries, having some apparatus for furnishing compressed air and a set of pipes the sounding of which was variously controlled. Soon after the tenth century great improvements were made, affecting every part of the mechanism. The process of mechanical development has been continuous ever since, and is still going on. The original impetus to this steady progress is due to the fact that the pipe-organ has been recognized ever since the fourth or fifth century as preeminently the church musical instrument. Until the sixteenth century no other instrument commanded the careful study of educated musicians. Its application to purely concert uses is comparatively recent. The modern pipe-organ consists essentially of three mechanical systems: the wind-supply, the compressed air used being technically called wind; the pipework, including the entire sound-producing apparatus; and the action, the mechanism by which the player controls the whole. The wind-supply includes two or more feeders, oblique bellows which are operated either by hand or by a water, gas, steam, or electric motor or engine; a storage-bellows, horizontal bellows into which the feeders open, and in which the air is kept at a uniform pressure by means of weights; wind-trunks, distributing the compressed air to the several parts of the instrument; and wind-chests, boxes directly under the pipes, in which are the valves for admitting the air to particular pipes or sets of pipes. Occasionally certain solo pipes are supplied with air from a special storage-bellows in which the tension is made greater by extra weights; such pipes are said to be on extra or heavy wind. The pipework includes a great variety of different kinds of pipes, made either of metal or of wood, arranged in sets called stops or registers, at least one pipe being usually provided in each set for each digital of the keyboard. In general, all pipes are either flue-pipes, which are either open at the upper end or plugged, or reed-pipes, the former producing tones through the impact of a stream of air upon the sharp edge or lip of a mouth in the side of the pipe, and the latter producing tones by the vibration of a tongue or reed placed over or in an orifice through which the air passes. (See *pipe*.) The pipes in a given set or stop are alike, except in size and pitch. The four principal qualities of tone produced are the true organ tone, given by open metal flue-pipes of broad scale; the flute-tone, given by stopped wooden flue-pipes; the string-tone, given by open metal flue-pipes of narrow scale; and the reed-tone, given by reed-pipes of various shape and material. A stop

whose tones correspond exactly with the normal pitch of the digitals with which the several pipes are connected is called an *eight-foot stop*; one whose tones are uniformly an octave lower is called a *sixteen-foot stop*; while those whose tones are uniformly one or two octaves higher are called *four-foot* and *two-foot stops* respectively. Stops whose tones are different from the normal pitch of the digitals used, or from their upper or lower octaves, are called *mutation-stops*, in distinction from the above *foundation-stops*. Stops that have more than one pipe to the digital are called *mixture-stops* or *mixtures*. It is customary to group together several stops of different construction, tone-quality, and pitch upon a single wind-chest, and such a group of stops constitutes a *partial organ*. Usually from two to five such groups of stops or partial organs are introduced, such as the *great organ*, the chief and most sonorous of all; the *swell-organ*, so called because shut up in a tight box one side of which consists of shutters which may be opened or shut so as to let out or muffle the sound; the *choir-organ*, specially intended for accompanying either voices or other stops of the organ itself; the *solo-organ*, providing stops of very conspicuous power and individuality; and the *pedal organ*, including deep-toned stops played from a keyboard for the feet, and supplying the fundamental tones of the harmony. The number, order, power, and quality of the stops placed in these several partial organs vary widely. Each is complete in itself, having its own wind-chest and keyboard, so that it can be used independently of the others; but by means of couplers any pair may be played conjointly from a single keyboard. (See *coupler*.) The action includes one keyboard for each partial organ, a stop-knob for each stop, a knob or piston for each coupler, a swell-pedal, combination pedals, etc. Keyboards for the hands are called *manuals*, and those for the feet *pedals*, each being made up of the usual white and black digitals or keys. The manuals usually have a compass of nearly or about five octaves, beginning on the second C below middle C, while the pedals have about half this compass, beginning an octave lower. The manuals are placed above each other in a desk-like case; when there are two, the lower belongs to the great organ, and the upper to the swell-organ; when there are three, the lowest belongs to the choir-organ. The stop knobs, bearing the names of the stops, are placed on both sides of the manuals, and are grouped according to the partial organs to which they belong. When a stop is to be used, its knob is pulled forward, or "drawn." Frequently *combination pedals* or *pistons* are provided, by which several knobs may be drawn or retired at once. Sometimes, also, a *crescendo pedal* is introduced, by which the entire resources of the instrument may be gradually called into action. The keyboards may be combined in various ways by means of couplers. The digitals of the keyboards are connected with the valves in the wind-chests by a complicated series of stickers, squares, rollers, trackers, etc., which are almost entirely made of wood. In large organs the friction of the key-action is so great that a pneumatic or electric action is employed, in which the digitals merely make connections so that compressed air or electricity may do the work. The stop-knobs are connected with the wind-chests by similar systems of levers, rods, squares, etc., which are also often pneumatically or electrically manipulated. When a digital on one of the keyboards is depressed, a valve is opened from the wind-chest belonging to that keyboard, admitting the compressed air to a groove or channel over which stand all the pipes belonging to the digital: only those pipes, however, are sounded that belong to the stops whose stop-knobs happen to be drawn. The opening and closing of the shutters of the *swell-box* is manipulated through a special *swell-pedal*. Various other mechanical accessories are often added, such as the *tremulant*, a device by which an oscillating tension is given to the air in one of the wind-trunks, the *pedal-check*, the *bellows-signal*, etc. The history of organ music until the sixteenth century was coincident with that of vocal music, for which it merely afforded a basis; but since that time it has had a remarkable independent development, particularly in the works of J. S. Bach. The organ has been much used in conjunction with choral music to enhance broad harmonic effects; and lately it has been also applied to the elaborate imitation of orchestral music. It remains the distinctively church instrument, although it is often found in concert-halls and in opera-houses. Formerly the instrument was often spoken of as a *pair of organs*, or simply *organs*.

His vois was merier than the merye orgon
On masse days that in the chirehe goon.
Chaucer, Nun's Priest's Tale, l. 32.

The chief Church of this city is curiously carved within and without, furnished with a *pair of organs*, and a most magnificent font, all of copper.
Evelyn, Diary, Sept. 17, 1641.

In 1501 the complete expression is met with, "one *peyre of organys*"; and it continued in use up to the time of Pepys, who wrote his "Diary" in the second half of the 17th century. Grove, Dict. Music, II. 587.

The term *organic*, as applied to any substance, in no way relates to the presence or absence of life. The materials which compose the living body are of course *organic* in the main, but they are equally so after death has occurred—at any rate for a certain time—and some of them continue to be so for an indefinite period after life has departed. Sugar, for example, is an *organic* product; but in itself it is of course dead, and it retains its stability after the organism which produced it has lost all vitality.
H. A. Nicholson.

Oribates (ō-rib'ā-tēz), *n.* [NL. (Latreille, 1804). < Gr. *ορειβάτης*, mountain-ranging, < *ὄρος*, a mountain, + *βαίνω*, go.] A genus of beetle-mites, typical of the family *Oribatula*, having the cephalothorax with lamellar appendages, the vertex with bristly hairs, and the middle claw larger than the others. There are probably many more species than have thus far been determined. *O. orientis* is a useful mite, which feeds on the eggs of the cankerworm-moth in the United States. Also *Oribates*.

Oribatidæ (or-i-bat'i-dē), *n. pl.* [NL., < *Oribates* + *-idæ*.] A family of tracheate acarids, typified by the genus *Oribates*. They are known as beetle-mites, from the hard horny integument, and also as wood-mites. The ocelli are almost obsolete, the mandibles chelate, the short palpi four-jointed, and the legs five-jointed, all ambulatory. None is parasitic at any age, or specially injurious, and some are beneficial. About 12 genera are described. The *Oribatidæ* are sometimes divided into 2 subfamilies, *Pterogasterinae* or *Oribatinae* proper, and *Oporogasterinae*, the latter containing 9 genera.

orichalc (or'i-kalk), *n.* [Formerly also *orichalche*; = F. *orichalque* = Sp. Pg. It. *orichalco*, < L. *orichalcum* (also erroneously *aurichalcum*, simulating *aurum*, gold), < Gr. *ορείχαλκος*, rarely *ορίχαλκος*, yellow copper ore, brass, lit. 'mountain-copper,' < *ὄρος*, mountain, + *χαλκός*, copper: see *chalchitis*.] The equivalent in English of the Greek *ορείχαλκος*, the name of a metallic alloy or metal of brilliant luster, mentioned by Greek authors of a very early date, and considered by them as worthy to be elassed with gold and silver in respect of value. Plato, while often speaking of it, admits that orichalc was no longer to be had in his time; and some (Aristotle, it is said, among them) deny that any such metal ever existed. The word passed into Latin under the form of *orichalcum*, and later that of *aurichalcum*. Although sometimes used as the name of brass (as by Strabo, who, with as near an approach to accuracy as was possible in those days, describes the method of manufacturing that metal and calls the alloy *orichalcum*), it had in general—even down to the middle ages—a more or less uncertain meaning, standing sometimes for an entirely ideal and very precious substance and sometimes for an ordinary metal or alloy (as copper or bronze), but having a peculiar value on account of the manner in which it was made, or the locality whence it came.

The metal was of rare and passing price; Not Bilbo steale, nor brass from Corinth fet, Nor costly *Orichalche* from strange Phenice, But such as could both Phœbus arrows ward, And th' hayling darts of heaven bearing hard. *Spenser*, *Mttopotmos*, l. 78.

gold: see *aurcole*, *aurcous*, and *ef. oriolc*.] A portico, recess, or small room forming a projection from a room or building, as a hall or chapel, in the form of a large bay or recessed window, and often more richly furnished or more private than the rest of the room or building, formerly used as a boudoir, closet, and separate apartment for various purposes. It projects from the outer face of the wall, being in plan semi-hexagonal, semi-octagonal, or rectangular, etc., and is supported on brackets, corbels, or corbeling. When such a projecting feature rests upon the ground, or directly upon the foundation of the building, it is called a *bay-window*, or a *bay-window*. Also called *oriel-window*.

E. B. Tylor, Prim. Culture, II. 352.

(c) The construction or position of a church so that it has that end which contains the chancel or sanctuary in the direction of the east.

The very ancient practice of *orientation* in the building of churches can hardly be set aside as "a High Church piece of pedantry." Allusion to worship towards the east may be found in the early liturgies and Church fathers; and in this country, at least, *orientation* has been practised from the first introduction of Christianity into these islands down to the present time, with the interruption of the Great Rebellion.
N. and Q., 7th ser., VII. 469.

(d) Hence, the position of a building or of any object with reference to any point of the compass.

The later builders of Thebes appear to have had no notion of *orientation*, but to have placed their buildings and tombs so as to avoid regularity, and facing in every conceivable direction.
J. Fergusson, Hist. Arch., 1. 96.

But let a man venture into an unfamiliar field, or where his results are not continually checked by experience, and all history shows that the most masculine intellect will oftentimes lose his *orientation* and waste his efforts in directions which bring him no nearer to his goal, or even carry him entirely astray. *C. S. Peirce, in Pop. Sci. Mo., XII. 4.*

4. The process of determining direction or relative position in general.

Tympanic sensibility plays no role in auditive *orientation*.

In *zoöl.*, the faculty or instinct by which birds and other animals find their way home after being carried to a distance. It is well illustrated by homing pigeons. (See *homing*.) A striking instance of orientation is also afforded by swallows. Thus, a swallow nesting in New England, for example, and wintering in Panama, can return to the latter in the barn where its nest was the previous year. All the regular and periodical migrations of birds imply the faculty of orientation.

Origenism (or'i-jen-iz-m), *n.* [*< Origen* (see *def.*) + *-ism*.] The opinions held by or attributed to the Greek father Origen of Alexandria (born about A. D. 185, died about 253). The main characteristics of Origen's teaching were its union of philosophical speculation with Christian doctrine and its mystical and al-
legorizing interpretation of Scripture. He insisted especially on the unity of all creation; he regarded Scripture as having generally a threefold sense, literal, moral, and mystical; he held the essential divinity and eternity of each person of the Trinity, but maintained that the Son is inferior to the Father and the Holy Ghost to the Son; he was the first to formulate the orthodox doctrine of eternal generation; he rejected prayer to Christ, though he defended prayer in the name of Christ; he regarded all sin as proceeding from a voluntary and moral self-determination to evil; he held that the human soul of Christ preëxisted with other human souls; that the soul came into the body as a penalty for sin in a preëxistent state; and he believed in a further moral progress and development after the present life, and defended as a probable opinion the restoration and final salvation of all men and of the fallen angels.

See *primary*.—**3. Inventive, creative.**

It directs that "such Ornaments of the Church, and the Ministers thereof, at all times of their Ministrations, shall be retained and be in use, as were in this Church of England, by the Authority of Parliament, in the Second Year of the Reign of King Edward the Sixth." Controversy as to the lawful ritual of the Church of England has centered for many years around the question whether the ornaments rubric is still in force. The decisions of the ecclesiastical and law courts on the subject have varied, and have not succeeded in putting an end to the controversy or in enforcing uniformity of usage. = *Syn.* Embellishment, adornment. The fur is thick and soft, of a glossy dark-brown color. The fact that the animal is oviparous (though not generally credited till 1854) has long been known, and the egg was figured many years ago. The eggs are about 3 inch long by 1 inch broad, white, with a flexible shell or pod, like a "soft-shelled" hen's egg. See cuts under *duckbill* and *interdactyle*.

The ilium extends far in advance of the acetabulum, and is expansive, widely arching over the pelvic cavity, as in birds. The slender prolonged ischia, in some genera, are ornithic in character, and, in *Hypsilophodon* at least, unite in a median ventral symphysis. The pubes in some genera are as slender and elongated as in a typical bird. The tibia has a great cnemial crest and a ridge for the fibula, and its distal end is as in a bird, with a fossa to receive the ascending process of the astragalus. The distal end of the fibula is smaller than the proximal, though not so much reduced as in birds. The astragals, similar to that of a bird, remained distinct in many genera; but in some, as *Compsognathus*, *Ornithotarsus*, and *Euskelosaurus*, it seems to have ankylosed with the tibia. The genera of *Ornithoscelida* are numerous, ranging throughout the Mesozoic period; the animals are mostly of large size, some of them, as the *iguanodon*, being among the largest terrestrial animals known. The order is divisible into two suborders, *Dinosauria* and *Compsognathia*.

orthochromatic (ôr-thô-krô-mat'ik), *a.* [*< Gr. ôphôc, correct, + chrôma, color: see chromatic.*] In *photog.*, correct in the relations or in the rendering of colors—that is, free from the usual photographic fault of exaggerating the deepness of greens, yellows, and reds and the brightness of blues and violets. The epithet notes any process by means of which this end may be attained, or any plate, chemical, etc., used in such a process. Ordinary photographic dry plates in which a trace of such agents as eosin or chlorophyl is incorporated possess the orthochromatic property, which is greatly enhanced if the exposure is made through a transparent screen tinted to correspond with the prevalent color in the scene or picture, as green for a landscape, or yellow for a painting characterized by draperies of that hue. Also expressed by *isochromatic*, an epithet implying equality of exposure to obtain similar results from opposed colors, contrary to the usual photographic experience.

orthochromatize (ôr-thô-krô-mâ-tiz), *v. l.; pret. and pp. orthochromatizéd, ppr. orthochromatizing.* [*< orthochromat(iz-) + -ize.*] In *photog.*, to render orthochromatic, as a plate; bring into conformity with the conditions necessary to obtain a correct rendering of color-values.

orthoclase (ôr-thô-klâz), *n.* [*< Gr. ôphôc, straight, right, + klâsis, fracture: see elastic.*] Common or potash feldspar, a silicate of aluminum and potassium, occurring in monoclinic crystals and also massive. It has two perfect cleavages, at right angles to each other (whence the name). It varies much in color, from white to yellow, red, and green. Adularia, including most moonstone, is a crystallized variety, transparent or nearly so, characteristic especially of the crystalline rocks of the Alps; valencianite, from Valenciana, Mexico, is similar to it. Sanidino is a glassy variety, usually containing more or less soda; it is characteristic of certain igneous rocks, as trachyte, phonolite, etc.; rhyacolite, from Monte Somma, Vesuvius, is similar. Loxocase is a variety from Hammond, New York, and murehlsonite one from Exeter, England, the latter showing golden-yellow reflections on a surface nearly parallel to the orthopinacoid. Orthoclase is an essential constituent of granite and other crystalline rocks, and often occurs in large masses in granite-veins, and is then quarried and used in making pottery. Much of the potash feldspar called orthoclase is really the related triclinic species microcline. The name *anorthoclase* has been given to some kinds of triclinic feldspar containing considerable potash, which are more closely related to albite than to microcline in optical characters. See *feldspar*. Also called *orthose*.

orthoclastic (ôr-thô-klas'tik), *a.* [*< Gr. ôphôc, straight, right, + klâstês, verbal adj. of klâo, break.*] Characterized by cleavages at right angles to one another: said of certain species of the feldspar group, particularly orthoclase; pertaining to such species, or specifically to orthoclase.

orthodiagonal (ôr-thô-di-ag'ô-nal), *n. and a.* [*< Gr. ôphôc, straight, + diâgonos, diagonal: see diagonal.*] *I. n.* In *crystal.*, the diagonal or lateral axis in a monoclinic solid which is at right angles with the vertical axis; also, the plane which includes the two axes named.

II. a. Pertaining to or in the direction of the orthodiagonal.

orthodomatic (ôr-thô-dô-mat'ik), *a.* [*< orthodomæ + -atic².*] Pertaining to or in the direction of an orthodomæ.

orthodome (ôr-thô-dôm), *n.* [*< Gr. ôphôc, straight, + dômos, dôma, a house: see domæ*, 5.] In *crystal.*, a dome, in the monoclinic system, parallel to that lateral axis which is at right angles to the vertical axis. It is properly a hemidome, since a given form includes but two planes. See *domæ*, 5.

orthodox (ôr-thô-doks), *a.* [= F. *orthodoxe* = Sp. *ortodoxo* = Pg. *orthodoxo* = It. *ortodosso*, *< Ll. orthodoxus*, *< LGr. ôphôdozôs, having a right opinion, < Gr. ôphôc, straight, right, correct, + dôza, opinion: see dogma, dozology.*] *1.* Holding what is regarded as the correct opinion, or correct opinions, especially in regard to religious or theological doctrines; sound in opinion or doctrine; specifically, conforming to the faith of the Church Catholic, as represented in its primitive ecumenical creeds: applied to persons or doctrines. That which seems to one part of the Christian church orthodox may be held by another to be heterodox. Thus, the Roman Catholic Church regards Protestant churches as heterodox; again, the Reformed churches sometimes deny the title *orthodox* to one another; and generally those who hold to the Trinitarian faith deny the epithet *orthodox* to the Unitarians and Universalists. Orthodoxy is not usually denied to those who are charged with having added articles to the ecumenical faith of Christendom, but only to those who are charged with denying a part of that faith. Thus, the Roman Catholic is not ordinarily refused by Protestants the right to the epithet *orthodox*; nor are Trinitarians denied the right to that epithet by those of Unitarian belief. *Orthodox* is the common epithet of the Greek Church (of which the full official title is "the Holy Orthodox Catholic Apostolic Oriental Church"), as *Catholic* is of the Roman Church. [The word is employed locally in New England to designate the Trinitarian Congregational churches as distinguished from those of the same order which hold the Unitarian or Universalist faith, as in the phrase "the *Orthodox* Church." It is also used to distinguish the Trinitarian Quakers from those whose belief is or tends toward Unitarianism.]

Thus the *Orthodox* Tenet, that there never was any remission of sins but by the blood of the Lamb that was slain from the beginning of the World.

E. A. Freeman, *Venice*, p. 198.

Orthodox school, in *polit. econ.* See *political*.—*Syn. 1. Orthodox, Evangelical.* (See the definitions of these terms.) It is natural for all who care about their doctrinal beliefs to claim the titles that indicate correctness of belief. Hence *orthodox* is a part of the name of the Greek Church; to the Roman Catholic *orthodox* means faithful to the tenets of the Roman Church; in the doctrinal contests of America *orthodox* has generally meant Calvinistic, especially as opposed to Unitarianism and Universalism; in England it has as generally meant High-church, as opposed to Low-church or *evangelical*. *Evangelical*, meaning in harmony with the Gospel, has been claimed somewhat similarly and for a like reason, but has been especially applied to those who emphasize the doctrine of salvation by faith in Christ alone.

shortness of the jaws which constitutes orthognathism. The facial angle of an orthognathous skull is large (by whichever method it is measured), the term being more or less definitely employed as the opposite of *prognathous* or *prognathous*, where the angle is small, or as the mean between *prognathous* and *hyperorthognathic* or *opisthognathous*, where the angle is excessively large. The facial angles that have been chiefly used in the definition of these terms are known as Camper's, Geoffroy Saint-Hilaire and Cuvier's, Jaquet's, and Cloquet's (which see, under *craniometry*). A more recent facial angle is that included between the nasio-alveolar line and a line drawn through the supra-auricular point and the inferior margin of the orbit; when this is between 83° and 90°, the skull is said to be orthognathous. The same character is also defined by means of the gnathic or alveolar index, those skulls with a gnathic index below 98 being orthognathous; between 98 and 103, mesognathous; and above 103, prognathous.

(Latreille, 1806) (F. *Orthoptères*, Olivier, 1789), neut. pl. of *Orthopterus*, straight-winged; see *orthopterous*.] An order of the class *Insecta* proposed by Olivier in 1789 for certain straight-winged insects which Linnaeus had placed in *Hemiptera*, and to which De Geer in 1773 had restricted the order *Hemiptera*, placing the true bugs in a new order *Dermaptera*. The order as now understood contains insects in which metamorphosis is incomplete and wings are almost always present, of which the hinder pair are dilated, folded from the base, and of membranous texture, while the fore pair are more or less coriaceous, usually narrow and straight (but variable in this respect), and thickly veined. These insects are active and capable of feeding in all stages from birth to death. Seven families — or, as some consider, tribes or superfamilies — are now recognized. These are the *Blattellidae*, or cockroaches; *Mantodea*, or praying-insects; *Phasmidae*, or walking-sticks; *Gryllidae*, or crickets; *Locustidae*, or long-horned grasshoppers or katydids; and *Aceridae*, or short-horned grasshoppers or true locusts, including the migratory species. (See *locust* for an explanation of the fact that the *Locustidae* are not locusts.) The *Orthoptera* are in the main herbivorous, but the *Mantodea* are carnivorous, and some of the *Blattellidae* are omnivorous. They are found all over the world, but most numerous in the tropics, where among them are the largest known representatives of the whole insect class. All the known species are terrestrial or arboreal, no aquatic forms having been discovered; and according to their habitual mode of progression the families have been grouped by Westwood as *Cursoria*, *Isoptoria*, *Asabulatoria*, and *Saltatoria*. The *Orthoptera* are among the earliest forms of insect life to appear in geologic time, and the *Blattellidae* in particular are very numerous in some geological formations. The main characters used in classifying the *Orthoptera* are derived from the modifications of the genitals, mouth-parts, and antennae. See cuts under *Blattellidae*, *Gryllidae*, *Insecta*, *katydid*, *locust*, and *Mantis*.

These words, as well as *oryktographie*, were somewhat extensively used by

Continental geologists, in the early part of the nineteenth century, with a meaning nearly equivalent to what is now comprehended under the terms *mineralogy* and *lithology*; and this also included more or less, according to the usage of various authors, of economical and mining or "applied" geology. Oscines (os'i-nēz), n. pl. [NL., < L. oscen (oscine), a singing bird, esp. in auaspies, a divining bird, < obs-, before, + canere, sing; see cant², chant.] A suborder of birds of the order Passeres, the Passeres aeromyodi, a group of singing birds, characterized by having several distinct pairs of intrinsic muscles of the syrinx inserted into the ends of the upper bronchial half-rings, constituting a complex and effective musical apparatus. The side of the tarsus is usually covered with a horny plate, meeting its fellow in a sharp ridge behind, and the primaries are nine, or ten in number, the first one being short or spurious. The Oscines are regarded as the highest or most perfectly developed representatives of the class of birds; they constitute the great majority of Passeres, the non-oscine Passeres forming another suborder. As originally used by Merrem in his classification of birds (1813), Oscines formed one of two divisions of that author's Hymenopteres, and was divided into Oscines emirostres, equivalent to the modern fringilline and tanarine birds, and Oscines tenuirostres, embracing a great variety of tenuirostral, dextirostral, and cultrirostral birds, together with some, such as Todus and Coracias, now excluded from Oscines. It is composed of small or very small dark-colored flies, distinguished from Chlorops by the extension of the marginal vein to the end of the fourth longitudinal vein, and from Siphonella by its shorter scutellum and impressed lower face. The larvae are mostly leaf-miners, and the flies are usually captured in grass. Many European and American species are described. O. frit or O. rasilator is very destructive to grain in Europe; and O. brassicae and O. trifolii respectively damage cabbage and clover in the United States.

osculate (os'kū-lāt), *v.*; pret. and pp. *osculated*, ppr. *osculating*. [*L. osculatus*, pp. of *osculari*, kiss, < *osculum*, a little mouth, a pretty mouth, a kiss, dim. of *os*, a mouth: see *os*², *oral*, etc.] I. *trans.* 1. To salute with a kiss; kiss. *Imp. Diet.*—2. In *geom.*, to have a higher contact with; touch as closely as possible. Thus, a plane or a circle is said to *osculate* a curve when it has three coincident points in common with the curve—that is, it occupies such a position (and in the case of the circle has such a size) that as it is brought up into this position three points of intersection with the curve run into one. A sphere is said to *osculate* a tortuous curve when it has four coincident points in common with the curve. In these cases, to *osculate* means to have the greatest number of coincident and successive points common to a fixed locus which is compatible with the general character of the locus which osculates; and some geometers restrict the word to this meaning. This meaning is also extended to time: thus, the *osculating* elements of a planet are those elliptic elements which would satisfy three exact observations made at times infinitely little removed from a given epoch. But *osculate* is also used loosely to mean merely that the loci in question have three or more coincident points in common. A tangent-line or -plane is never said to *osculate* a curve or surface unless it has more than ordinary contact with it.

II. *intrans.* 1. To kiss one another; kiss. *Imp. Diet.*—2. In *geom.*, to have, as two loci, three or more coincident and successive points in common. See I., 2.—3. He is son of Seb and Nut, or Heaven and Earth. His antagonist is Set, the deity of evil or darkness, by whom he is slain; but he is avenged by Horus, and reigns in the lower world. With him was formally identified every departed soul in his nether abode, to be protected by him in the necessary conflict with the genius of evil. The worship of Osiris was extended, at about the beginning of the Christian era, over Asia Minor, Greece, and Rome. In art Osiris is usually represented as a mummy, wearing the crown of Upper Egypt, often flanked by ostrich-plumes. The accompanying cut represents a bronze figurine in the Metropolitan Museum of Art, New York.

They are mostly of small size and metallic colors; the antennæ are simple and similar in both sexes; the maxillary palpi are four-jointed; and the abdomen is globose. It does not occur native, but has been found to constitute a part of the native platinum of all the platinumiferous regions (South America, California, Australia, Russia), in the form of iridosmium, an alloy of the metals osmium and iridium. The specific gravity of the artificially obtained metal has been found to be 22.477; hence it is the heaviest of those bodies. It has never been fused. Its crystalline form is either that of the cube or that of a very obtuse rhombohedron. The crystals are of a bluish-white color, with a violet luster, and are harder than glass. Osmium is not used in the arts, except in the form of iridosmium, of which material the tips of gold pens are made.

osmose (os'mōs), n. [*osmosis*, < Gr. ὄσμος, impulsion, pushing, < ὄθειν, thrust, push, impel.] The impulse or tendency of fluids to pass through porous partitions and mix or become diffused through each other; the phenomena attending the passage of fluids, whether liquids or gases, through a porous septum. It is a kind of diffusion (see *diffusion*), and includes *endosmosis* and *exosmosis*—the former being distinguished either as the tendency of the outer fluid to pass through into the inner, or as the action of that fluid which passes with the greater rapidity into the other. When two saline solutions differing in strength and composition are separated by a porous diaphragm or septum of bladder, parchment-paper, or porous earthenware, they mutually pass through and mix with each other; but they pass with unequal rapidities, so that after a time the height of the liquid is not the same on both sides. These phenomena are explained by the unequal molecular attraction exerted between the capillary apertures in the porous diaphragm and the different liquids experimented upon.

A genus of handsome ferns, widely distributed throughout north temperate regions, and typical of the order *Osmonda*.

The fronds are tall and upright, growing in large crowns from a thickened rootstock, and are once or twice pinnate. The fertile fronds or the fertile parts of the fronds are destitute of chlorophyl, very much contracted, and bear on the margins of the narrow rachis-like divisions the naked short-pedicelled sporangia, which are globular, thin, and reticulated, and open by a longitudinal cleft into two halves. The spores are green. 2†. Capable of being shown; that may be shown; proper or intended to be shown.—Ostensible partner, in law, a partner whose name is made known, and who appears to the world, as such, as distinguished from a secret or dormant partner; also used in distinction from one so known who is really not such, called a *nominal partner*. = Syn. 1. *Ostensible*, *Colorable*, *Specious*, *Plausible*. The first three of these words are drawn from that which is addressed to the eye, *plausible* from that which is addressed to the ear. *Ostensible* is, literally, that may be or is held out as true, real, actual, or intended, but may or may not be so; thus, a person's ostensible motive for some action is the motive that appears to the observer, and is held out to him as the real motive, which it may or may not be. *Colorable* suggests the possibility of giving the color or aspect of one thing to another, especially of giving the appearance of truth or justice; it has a bad sense, but approaches a good one in the following: "All his [James I. of Scotland's] acquisitions, however fatal to the body of the nobles, had been gained by attacks upon individuals; and, being founded on circumstances peculiar to the persons who suffered, might excite murmurs and apprehensions, but afforded no colorable pretext for a general rebellion" (*Robertson*, quoted in *Crabbe*, p. 215). The word is much the least often used of the four. *Specious* is superficially fair, just, or correct, appearing well at first view but easily proved unsound. *Plausible* is applied to that which pleases the ear or the superficial judgment, but will not bear severe examination. *Ostensible* reasons; *colorable* claims; *specious* means; *plausible* explanations.

A political measure employed under restrictions of law among the ancient Athenians, by which citizens whose presence seemed embarrassing to the state were banished by public vote for a term of ten years, with leave to return to the enjoyment of their estates at the end of the period. It has its name from the tablet of earthenware (*ostrakon*) on which every voter wrote the name of the person he desired to ostracize. Ostracism was practised in some other democratic states of Greece, as Argos and Megara, but the method of its administration, except in Athens, remains obscure. Compare *petalism*.

It is characterized by a large, hard, and often calcified bivalve shell, or hinged shell-like valves, consisting of two unequal lateral parts of an unsymmetrical carapace, movably joined together and often peculiarly ornamented; a rudimentary abdomen; a very small shell-gland; the body not ringed, ending in a bill tail; very few thoracic appendages (generally two or three), not foliaceous, but cylindrical, like the legs of higher crustaceans; branchiae attached to the oral appendages; eyes, when present, median and coalesced or lateral and separate; and antennules and antennae large and subserving locomotion. The *Ostracopoda* are mostly minute fresh-water crustaceans, swimming very actively by means of their antennae; some carry their eggs about with them like ordinary *Crustacea*, but most attach them to foreign substances, as aquatic plants. These crustaceans are common in all geologic strata from the earlier Paleozoic formations, and appear to have undergone little modification. There are several families and a number of genera, such as *Cypris* and *Cythere*. Also called *Ostracoda* and *Ostrapoda*. See cuts under *Cypris* and *Cythereidae*.

There are upward of 200 species, besides many natural and artificial varieties. The genus extends back to the Carboniferous, and there are more species extinct than extant. The common edible oyster of Europe is *O. edulis*; that of the Atlantic coast of the United States is *O. virginica*. See also cuts under *ciborium* and *integropalliate*.

This distinction of two interior vehicles or tunics of the soul, besides that outer vestment of the terrestrial body (styled in Plato *τὸ ὀστρεώδες*, the crustaceous or *ostreaceous* body), is not a mere figment of the latter Platonists since Christianity, but a tradition derived down from antiquity. Ostreidae (os-trē-i-dē), *n. pl.* [NL., < *Ostrea* + *-idae*.] A family of monomyarian bivalve mollusks, the oysters, typified by the genus *Ostrea*, to which various limits have been assigned. (a) In Woodward's and older systems, a large group including all forms with the mantle quite open, a very small

foot or none, an inequivalve shell, free or adherent to foreign bodies, resting on one valve, with central beaks, internal ligament, single adductor muscle, and obscure pallial line. Thus it included not only the *Ostreidae* proper, but also *Anomidae*, *Placunidae*, *Pectinidae*, *Limidae*, and *Spondyliidae*. (b) Now restricted to oysters which have the mantle-margin double and finely fringed, nearly equal gills united to one another behind, and the mantle lobes forming a complete branchial chamber. The shell is irregular, being both inequivalve and inequilateral, attached by the left valve, and the ligament-cavity is triangular or elongated. In structure the shell is subnacreous, and laminated with prismatic cellular substance. Thus limited, the *Ostreidae* contain only the oysters and closely related bivalves, of which there are many species, extinct and extant. Pearl-oysters belong to a different though related family, *Arculidae*.

eggs appear to be hatched mainly by incubation, both parents relieving each other in the task, but also partly by the heat of the sun. The South African ostrich is often considered as a distinct species under the name of *S. australis*. Three South American birds of the genus *Rhea* are popularly known as the *American ostrich*, though they are not very closely allied to the true ostrich, differing in having three-toed feet and in many other respects. The best-known of the three is *R. americana*, the *vandu* or *vanduyagu* of the Brazilians, inhabiting the great American pampas south of the equator. It is considerably smaller than the true ostrich, and its plumage is much inferior. *R. darwini*, a native of Patagonia, is still smaller, and belongs to a different subgenus (*Ptilonemia*). The third species is the *R. macrorhyncha*, so called from its long bill; it is perhaps only a variety of the first.

In fishes and fish-like vertebrates they are sometimes of great size. In higher animals otoliths are generally wanting or reduced to small particles or ear-dust. (See *otoconium*.) Among some common fishes the otolith decreases in size in the following order: cod, hake, haddock, whiting, conger, turbot, sole, gurnard, smelt, and trout. The concretions differ much in shape. In the conger the otolith is shaped like a sole, 1½ inches long, ¾ inch wide, and is thin and classy. In the cod it is of the size of a horse-bean, and is curved on itself. The ear-stones of the American sheephead are shaped like a tamarind-seed, and look like pieces of milky quartz. They are often carried in the pocket as "lucky stones."

Canada Otter (Lutra canadensis).

der Fera, family Mustelida, and subfamily Lutrinae. There are several genera, as *Barangia* (or *Lep-tonyx*), *Aonyx*, *Lontra* (or *Sarcocvia*), *Lutra* proper, *Hydrogale*, and *Pteronura*. They all have large flattish heads, short ears, webbed toes, crooked nails, and tails slightly flattened horizontally. The common river-otter, the *Lutra vulgaris* of Europe, is a quadruped adapted to amphibious habits by its short, strong, flexible, palmated feet, which serve as oars to propel it through the water, and by its long and strong tail, which acts as a powerful rudder, and enables the animal to change its course with great ease and rapidity. It inhabits the banks of rivers, and feeds principally on fish. When its retreat is found, the otter instantly takes the water and dives, remaining a long time underneath it, and rising at a considerable distance from the place where it dived. The weight of a full-grown male is from 20 to 24 pounds, and its length is about 2 feet exclusive of the tail. In many parts of England, and especially in Wales, the otter is hunted with dogs trained for this purpose. The other species of *Lutra* proper, which are found in different parts of the world, do not differ greatly from the European otter. The American otter is a quite distinct species, *Lutra (Lutra) canadensis*. Some Asiatic otters with reduced claws constitute the genus *Aonyx*. There are South American otters, as *Lutra brasiliensis* and *L. chilensis*. The most remarkable form is the winged-tailed or margin-tailed otter

-ous. [*ME. -ous, -ouse*; < *OF. -ous, -os, -us, -cus*, later *-our, F. -eur* = *Sp. Pg. It. -oso*, < *L. -osus*, for **-onsus*, orig. (Aryan) **-acanus, *-wautu*, a suffix (equivalent to *E. -ful* or *-y¹* or *-ed²*) attached to nouns to form adjectives noting fullness, as in *callosus*, hard-skinned, callous, *famosus*, noted, famous, *generosus*, well-born, generous, *odiosus*, hateful, odious, *religiosus*, scrupulous, religious, *sumptuosus*, costly, sumptuous, *ritiosus*, faulty, vicious, etc.] A suffix of Latin origin, forming, from nouns, adjectives denoting fullness or abundance, or sometimes merely the presence, of the thing or quality expressed by the noun, as in *callous, famous,*

generous, odious, religious, sumptuous, vicious, etc. (see *etymology*). Many modern English adjectives taken directly from the Latin have *-ose*, as *juvose, verbose*, with or without an equivalent form in *-ous*, as *herbous herbous, oneroso oneroso, vinoso vinoso, apicous apicose*, etc., the form in *-ose* being especially common in botanical terms. By reason of the agreement in the terminal pronunciation of English adjectives in *-ous* and the English pronunciation of Latin adjectives in *-us* (in Latin a mere nominative termination), many such adjectives in *-us* have been transferred into English with the accommodated termination *-ous*, as *anxious, conspicuous, devious, obvious, previous, serious*, etc., from Latin *anxius, conspicuus, devious, obviuus, praeuiuus, seriuus*, etc. So with Latin or New Latin adjectives in *-us* from Greek *-os*, as in *acephalous*, etc. The suffix *-ous* is felt as an English formative only when a noun accompanies the adjective, as in *famous, odious, religious, ambitious*, etc., associated with the nouns *fame, odium, religion, ambition*, etc. It is sometimes used (as also *-ose*), as an English formative, attached to words of non-Latin origin, as in *quartzous* or *quartzose*, etc.

outcrop (out-'krop), *n.* The appearing at the surface of a stratum or series of strata, or of a vein or ore-deposit of any kind. The outcrop of a metalliferous vein or lode is frequently more or less concealed by the accumulation of partly decomposed material (see *gossan*), the result of the decomposition and oxidation of the metalliferous part of the lode by atmospheric agencies. This is called by Cornish miners the *brail*. The outcrops of many veins, on the other hand, are very conspicuous, especially when the amount of ore present is small, quartz forming the predominating vein-stone of a large proportion of the mineral deposits, and being very indestructible. The outcrops of the stratified formations depend on the amount of inclination of the beds. When these lie quite horizontal, there can be no outcropping edges of the strata, except when the formation has been cut into by erosion. The position on the surface of any outcrop depends, therefore, on the inclination of the bed or vein in question, and on the nature and amount of the erosion which has taken place. See *cut under dip*.

In the earliest times outlawry

seems to have implied exclusion from all the protections and remedies with which the law guarded lawful men, but by successive ameliorations it was reduced in effect to the rule that it incapacitated a person for prosecuting actions for his own benefit, though he might still defend himself. In capital cases, as treason or felony, failure to appear was a sufficient evidence of guilt, and process of outlawry thereon entailed forfeiture of his personal estate. *Fugitation* is a term of similar meaning in Scots law.

He was holdun in outlawrie of Donycian in the yle Patmos.

See *crewel-stitch*, *stem-stitch*, *rope-stitch*. = *Syn. Outline, Contour, Profile, Sketch, Delineation*. Outline is, literally, the outer or exterior line; but the word is freely used for a representation by the principal or distinguishing lines. *Contour* and *profile* retain this distinctive meaning of the outside line, the former referring to the boundary of the whole figure in any position, and the latter to the boundary of face or figure when seen directly from one side, with figurative uses in architecture and surveying. A sketch fills up the outline to a greater or less degree, not completely, but so that a lively idea of the original object or scene is conveyed. *Delineation* is rather indefinite, but is more than an outline and may be complete. *Outline, sketch*, and *delineation* bear the same relation to one another when used to express the representation of a subject in words.

That part of a female animal in which ova, eggs, or germs are generated and matured; the essential female organ of reproduction, corresponding to the testes of the male; the female genital gland or germ-gland; the ovarium. In vertebrates the ovary is a glandular organ, usually paired, sometimes single, and morphologically identical with the testes, both these organs being developed from a primitively indifferent genital gland common to both sexes, the differentiation of this structure into ovary or testes being the fundamental distinction of sex upon which all other sexual differences are consequent. The ovary consists of its proper stroma or tissue peculiar to itself, in which the ova are produced, bound up in ordinary connective tissue, supplied with appropriate vessels or nerves, and fixed in the abdominal cavity by means of a mesentery. With the ovary is usually but not always associated a special structure, the *oviduct*, serving to convey away the eggs. The ovary is relatively largest in those animals which lay multitudinous eggs, as fishes, in which it is known as the *roe*. It is also large in oviparous animals which lay large meroblastic eggs with copious food-yolks, as birds and most reptiles. It is very small in mammals. The ovary in woman is a flattened ovoid body about 1½ inches long, ¾ inch wide, and ½ inch thick, resting on the broad ligament of the uterus and closely connected both with that organ and with the Fallopian tube or oviduct. Among invertebrates in which there is distinction of sex, the name *ovary* is applied to any part of the body which can be recognized as having the function of ovulation. Such organs are of almost endlessly varied character in all but the one essential physiological respect. Several kinds of ovaries receive specific names; and in many cases the analogy to

Female Generative Organs of the Cockerroach (*Periplaneta orientalis*), showing ovarioles; enlarged 3½ times. a, posterior abdominal ganglion; b, right and left oviducts, formed by union of c, d, e, the ovarian tubes or ovarioles; f, filament by which ovarioles of opposite sides are united; g, spermatheca; h, h, the colleterial glands, or colleterium.

the part of a plant called the ovary (see def. 2) is striking. See cuts under *Dibranchiata* and *Nematodea*.

2. In bot., a closed case or receptacle, the lower section of the pistil, inclosing the ovules or young seeds, and ultimately becoming the fruit. Structurally the ovary is a modified leaf which is folded involutely so as to form a cavity, and with the style and stigma it constitutes the female sexual organs (gynoecium) of flowering plants. The ovary may be simple (that is, composed of a single leaf), or compounded (of two or more leaves). The modified part of the interior of the ovary which bears the ovules is called the *placenta* (which see).

The phrases *superior* and *inferior* ovary are used to designate the position of the ovary in relation to that of the floral envelopes: thus, *ovary superior* is that in which the other parts of the flower are inserted upon the axis below the ovary; *ovary inferior* is that in which the other parts of the flower are inserted above, seemingly upon the ovary. See cuts under *anthophore*, *Aracea*, *Didymna*, *dicranus*, and *myrtle*.

A chamber or receptacle in which food is cooked by the heat radiated from the walls, roof, or floor. (a) A chamber built of brick, tiles, or the like, and usually heated by fuel which is allowed to burn away before the food is introduced, the cooking being done by the heat retained. (b) A chamber for baking or cooking in a cooking-stove, range, or furnace, the heat being usually transmitted through one or more of the sides.

In stead of bread they drie a kind of fish which they heat in mortars to powder, and bake it in their *ovens*, until it be hard and drie.

Hollinshed, *Descrip. of Britain*, I. x.

2. In general, any inclosed chamber adapted to or used for applying heat to raw materials or to articles in process of manufacture. The heat so applied may be radiated from the previously or continuously heated walls of the inclosure, or it may be derived from currents of heated air or gases or superheated vapors circulated through the oven, from interior or exterior coils of pipes heated by steam or hot water, or from the solar rays. The name *oven* is given to a great variety of structures and devices employed in domestic industry, in chemical operations, and in the mechanical arts. Specifically—(a) A kiln. (b) A muffle-furnace. (c) A leer.

3. A furnace.

The king's servants, that put them in, ceased not to make the *oven* hot with rosin, pitch, tow, and small wood; so that the flame streamed forth above the furnace forty and nine cubits.

Song of the Three Holy Children (Apocrypha), v. 23.

4. An oven-bird or its nest.—**Air-oven**, an oven in which baking or drying is done by circulating heated air through it. It is much used in laboratories and in the arts. In some cases, as in drying gelatin plates for photography, the air is filtered on its way to the oven by passing it through cotton-wool. In air-ovens the air may be heated prior to its admission, or by interior heating appliances.—**Annealing-oven**, an oven used for annealing, as the leer of glass-manufactories for slowly cooling glass, which, if cooled rapidly, would be exceedingly brittle; or, as in the manufacture of malleable iron-castings, the inclosure in which the articles, after casting, are treated to render them malleable.—**Bakers' oven**, an oven used by bakers in baking bread, biscuits, crackers, wafers, etc., on a large scale; re-ovens and rotary ovens are used.—**Beehive oven**. See *beehive*.

—**Brick oven**, an oven constructed of brick, in contradistinction to an oven made of metal or other material. Brick ovens usually apply their heat from their walls previously heated by an interior fire, which is withdrawn prior to putting in the article to be baked. Such an oven for domestic use was once very common in dwellings, and was generally built at the side of or in close proximity to the chimney then in use. It often projected from the exterior of the building, and this construction is still to be seen in many old country houses. It has a smoke-uptake in the upper part of the mouth and a flue leading from the uptake, and connects at its upper end with the fireplace-chimney. Wood is the fuel used, and when the fire is kindled the air draws into the mouth and passes over the bottom of the oven, while the heated gases of combustion rise to the top and pass forward to the uptake.—**Bush-oven**, the long-tailed titmouse or oven-bird, *Acerdula rosea*. [*Norfolk, Eng.*]—**Drying-oven**, an oven used for expelling moisture from substances or textures. The air-oven is the most generally used of this class. Drying-ovens heated to a point somewhat above the boiling-point of water, which expel water by converting it into steam, are also used for many purposes.—**Dutch oven**, a tin utensil for roasting meat, etc., closed at the sides, back, top, and bottom, and somewhat resembling in shape an open shed. The oven covers the joint or other article to be roasted on all sides except that facing the fire. (Also called *kitchen* or *tin kitchen* in the New England States and elsewhere.) The bake-kettle, a cast-iron vessel with a close-fitting convex cover upon which hot embers or coals are placed when the implement is used, is also sometimes called a *Dutch oven*.—**Egyptian oven**, a large earthen crock sunk in the ground, and heated by interior fire, which is removed to permit the baking of lumps of dough. These are thrown with force against the interior, and adhere thereto. The crock is then covered till the baking is finished. This is a very ancient form of oven, largely used in the East even to the present day.—**Elevated oven**, a range-oven situated higher than the fire-pot.—**Heating-oven**, an oven designed or used for simple heating, as in heating pieces of wood or other materials to be joined by glue or cement, or for heating vessels that must be used while hot; a hot-closet.—**Out-oven**, a domestic brick oven built by itself, apart from any building. Its construction is almost identical with that

described under *brick oven*, except that it has a chimney extending straight upward over the mouth of the oven.—**Reel oven**, an oven in which the substances to be baked or dried are placed on swinging shelves attached to endless chains running on reels within a heated inclosure. The reels are turned at a velocity that permits the articles to be dried sufficiently, or baked completely, when the chain makes a complete circuit, which brings one of the swinging shelves on a level with the door of the oven. The finished articles are then removed from this shelf, and a new charge is put in their place. This discharging and recharging is successively performed for each shelf. Generally, ovens of this kind and rotary ovens are continuously heated by circulation of heated air through them, or by heated air through their walls, or by highly heated steam-coils.

—**Revolving oven**, an oven in which the floor, or the shelves supporting the articles to be baked, etc., revolve horizontally or vertically. The articles are completely dried or baked in a single revolution, and are successively removed and replaced by new charges, as described under *reel oven*, which is an example of this kind of oven. In some ovens of this class a shaft with radial arms carrying swinging shelves rotates vertically in the heated inclosure. The manipulation and heating are as described under *reel oven*.—**Rotary-hearth oven**, an oven in which the floor or hearth revolves.—**Rotary oven**, an oven which can be horizontally rotated as a whole on a central pivot. Such ovens were formerly used with a form of kitchen stove called *rotary stove*. They were portable tin ovens made to fit the tops of the stoves, which were circular, and constructed to rotate on a central pivot. The top of the stove was toothed on the under side of its outer margin. The teeth were engaged by a small pinion operated by a crank. The articles to be baked were placed on the top of the stove, and covered with the portable tin oven, and, to prevent overheating of any part, the top of the stove was frequently turned to change the position of the parts relatively to the fire-pot.—**Traveling-apron oven**, an oven in which an endless belt traverses horizontally, carrying the articles to be baked from end to end of the oven. (See also *cake-oven*, *porcelain-oven*, *roasting-oven*, and *tile-oven*.)

4. In *music*, an orchestral movement properly
serving as a prelude or introduction to an ex-
tended work, as an opera or oratorio. Its form
varies from a brief flourish to a medley of melodies or
themes extracted from the body of the work, or to a
composition of independent form complete in itself. In
some cases overtures are divided into two or more sec-
tions or movements, resembling those of a suite or a sym-
phony, each modeled upon some dance form, the sonata
form, the fugue form, etc.; but they are more frequently
in a single continuous movement. Many veritable over-
tures being successfully used as concert pieces, it is now
customary to give the name to detached works for orchestra
which are intended simply for concert use, though in
such cases a special title is usually given to the composi-
tion.

5. Something offered to open the way to some
conclusion; something proposed for accep-

leigh] of procuring his pardon for 1500*l.*

Specifically—**6.** *Eccl.*, in Presbyterian church
law, a formal proposal submitted to an ecclesi-
astical court. An overture may proceed either from
an inferior court or from one or more members of the
court to which it is presented. In the General Assem-
bly of the Church of Scotland (as in the supreme courts
of most Presbyterian churches) legislative action is in-
itiated by adopting an overture and sending it to presby-
teries for their consideration. See the quotation.

Before the General Assembly passes any Acts which are
to be binding rules and constitutions to the Church, . . .
the same must be first proposed as an *overture* to the As-
sembly, and, being passed by them as such, be remitted
to the consideration of the several Presbyteries of this
Church, and their opinions and consent reported to the
next General Assembly. . . . If returns . . . show that
a majority of the Presbyteries approve, the *overture* as sent
down may then be passed, and most frequently is passed,
into an Act by the Assembly.
W. Mair, Digest of Church Laws, p. 36.

ing: as, to *subvert* the very foundations of justice. To
invert is primarily to turn upside down, but it may be
used figuratively, of things not material, for turning wrong

oviduct (ō-vi-dukt), *n.* [*< NL. oviductus, < L. ovum, egg, + ductus, a leading, duct: see duct.*] The excretory duct of the female genital gland, or female gonaduct; a passage for the ovum or egg from the ovary of an animal: chiefly applied to such a structure in an oviparous animal, not differentiated into Fallopian tube, womb, and vagina. An oviduct exists in most vertebrates, and is usually paired, there being one to each ovary, but often single, the duct of one or the other side remaining undeveloped, as in birds. When well formed, as in birds and other animals which lay large eggs to be hatched outside the body, the oviduct is a musculo-membranous tube or canal, of which one end is in relation with or applied to the ovary, and the other debouches in the cloaca, the tube being held in place by a special mesentery or mesometrium. In the course of the oviduct its mucous membrane acquires special characteristics, and secretes different substances; so that the ovum, escaping from the ovary as a ball of yellow yolk, becomes successively coated with white albumen, with a soft egg-pod, and finally, as in birds, with a hard chalky shell. The oviducts of the lowest mammals, which are oviparous, are of similar character; but in most mammals the pair of oviducts coalesce in the greater part of their length, whence result a single vagina and womb, with a pair of Fallopian tubes or oviducts in a restricted sense. A womb or uterus is simply a specialized part of an oviduct, where the ovum is detained long enough to be developed into a fetus and born alive. The oviducts of invertebrates, where any exist, are as diverse in character as the ovaries. See *ovary*, and cuts under *Dendrocoela*, *Dibranchiata*, *Echinozoa*, and *germarium*.

It forms the end of the abdomen, several of the rings or somites of which are specially modified for this purpose. It normally or usually consists of three pairs of lobes, the outer two pairs of which incise or sheathe the inner pair, and form an extensible tube, of

Ovoviviparous (ō'vō-vī-vip'ā-rus), *a.* [*< NL. ovoviviparus*, *< L. ovum*, egg, + *L. viviparus*, bringing forth alive; see *viviparous*.] Producing eggs which are hatched within the body of the parent but without placental attachment, so that the young are born alive, yet have not been developed in that direct connection with the blood-vessels of the mother which is characteristic of viviparous animals. Ovoviviparous animals are intermediate in this respect between oviparous and viviparous ones, whence the name. The process is a kind of internal incubation, but not a true gestation or pregnancy. It occurs in some fishes, many reptiles, some insects, as flesh-flies, various worms, and a great many other invertebrates. The carrying of eggs in any special receptacle about the body, from the time they leave the ovary until they hatch, also constitutes ovoviviparity. The implantal mammals, as marsupials, whose young are born very imperfect and then placed in a pouch, are sometimes called ovoviviparous.

Ovulation (ō-vū-lā'shōn), *n.* [*< ovulate*, *v.*, + *-ion*.] The formation or production of ova or ovules; also, a discharge of an ovum from the ovary. In women ovulation normally recurs thirteen times a year during the sexual life of the individual, and is accompanied by the phenomena of menstruation.

Ovule (ō'vūl), *n.* [*< F. ovule*, *< ML. ovulum*, a little egg (*NL.* an ovule), dim. of *L. ovum*, egg; see *ovum*.] 1. A little egg; specifically, in *anat.*, *physiol.*, and *zool.*, an ovulum or ovum, especially a small one, as that of a mammal, or one not yet matured and discharged from the ovary; specifically applied by Haeckel to the ovum or fertilizable but unfertilized egg-cell of the female, conformable with the use of *spermule* for the male sperm-eell. Its protoplasm is termed by him *ovoplasm*, and its nucleus *ovococcus*.—2. In *bot.*, a young or rudimentary seed; a peculiar outgrowth or production of the carpel which, upon fertilization and the formation of an embryo within, becomes the seed. In the angiospermous gynaecium the ovules are normally produced along the margins, or some part of the margins, of the carpellary leaf, either immediately or by the intermediation of a placenta, which is a more or less evident development of the leaf-margins for the support of the ovules. Rarely ovules are developed from the whole internal surface of the ovary, or from various parts of it, in no definite order, directly from the walls, and without the intervention of anything which can be regarded as a placenta. In gymnosperms the ovules are borne on the face of the carpellary scale or at its base; or on metamorphosed leaf-margins, as in *Cycas*; or, when there is no representative of the carpel on the cauline axis, seemingly as a direct growth of it. (*Gray*.) The only essential part of the ovule is its *nucleus*, or *nucellus*, as it has been termed recently, which is usually invested by one or two coats, the *prinine* and *secondine*. The coats are saes with a narrow orifice called the *stomium*, the closed vestige of which becomes the *micropyle* in the seed. The proper base of the ovule is the *chalazā*, and it may be either sessile or on a stalk (funiculus) of its own. The *hilum* is the scar left when the seed is detached from its funiculus. As to shape ovules may be orthotropous, campylotropous, amphitropous, or anatropous; and as to position in the ovary they may be erect, ascending, horizontal, pendulous, or suspended. In regard to numbers they may be solitary, few, or indefinitely numerous. See cuts under *accumbent*, *anatropous*, *funicle*, *maternalia*, *orthotropous*, and *ovary*.

ovum (ō'vum), *n.*; *pl. ora* (ō'vā). [L., = Gr. *ovon*, an egg: see *egg*.] 1. An egg, in a broad biological sense; the proper product of an ovary; the female germ or seed, which when fertilized by the male sperm, and sometimes without such fecundation, is capable of developing into an individual like the parent. There is a great similarity in the ova of different animals throughout the metazoic series, from the sponge to the human being, no ova in their early stages being distinguishable from one another in their essential characters. All true ova, as distinguished from spores and products of fission or gemmation, are referable to the single morphological type of the *cell*; and they are furthermore indistinguishable from unicellular animals, and from many of the cells composing the bodies of the higher animals. An ovum consists of a quantity of protoplasm or cell-substance called the *vitellus* or *yolk*, inclosed in a cell-wall or vitelline membrane, and provided with a nucleus and usually a nucleolus; it is engendered in the ovarium, usually in an ovisac or so-called Graafian follicle, is discharged from its matrix, usually then meeting with the male element, and proceeds to develop within or without the body of the parent. The ovum proper, like most cells, is usually of microscopic size; but its bulk may be enormously increased by the addition of extrinsic or adventitious protoplasmic or albuminous substance, and it may be further protected by various kinds of egg-pod or egg-shell, all without losing its essential character as a cell. The largest ova, relatively and absolutely, are birds' eggs, these being by far the largest cells known in the animal kingdom. Here the quantity of food-yolk which does not undergo transformation into the body of the chick is out of all proportion to the formative yolk proper, which makes only a speck in the great ball of "yellow" and "white." Such ova are called *meroblastic*, in distinction from *holoblastic*. The human ovum is very minute, relatively and absolutely, averaging about $\frac{1}{160}$ of an inch in diameter. It is said to have been first recognized by K. E. von Baer in 1827. The parts of the ovum have been badly named, without reference to its morphology as a cell. Thus, the cell-wall is called the *zona pellucida*; the nucleus is named the *germinal vesicle* or *vesicle of Purkinje*, and its nucleolus the *germinal spot* or *spot of Wagner*. The phrases *germinal vesicle* and *germinal spot* are misleading. The first stages of development of an ovum, consequent upon fertilization, consist in the *segmentation of the vitellus*, or yolk-division, by which the cell-substance becomes a mulberry-mass of spherules, called the *morula*. The rest is an intricate process of differentiation and specialization of these spherules, and their multiplications into the myriads of different kinds of cells of which the whole body of most adult animals is fabricated. Some of the early special stages of this process are known as the *morula*, *gastrula*, *blastula*, etc. The first tissue or coherent layer of cells produced is called a *blastoderm*. When there are two layers, inner and outer blastodermic layers, they are distinguished as *endoderm* and *ectoderm*; when a third intermediate layer is formed, it is the *mesoderm*. An ovum is called, in general, a *germ* until the rudiments of its specific characters appear, when it becomes an *embryo*, and later may be a *fetus*. That department of ontology which treats of the development of the ovum is *embryology*. See

A raptorial nocturnal bird of prey of the family *Strigidae*. Owls constitute a highly monomorphic group, the suborder *Striges* of the order *Raptores*. With few exceptions, they are of distinctively nocturnal habits and a peculiar physiognomy produced by the great size and breadth of the head and the shortened face with large eyes looking forward and usually set in a facial ruff or disk of modified feathers, which hide the base of the bill. Many owls have also "horns" (that is, ear-tufts) or plumicorns. The bill is hooked, but never toothed, and the nostrils open at the edge of the cere, not in it. The plumage is very soft and blended, without aftershirts, and the flight is noiseless. The talons are large, sharp, and hooked as in other birds of prey; the outer toe is versatile; and the feet are usually feathered to the claws. (See *ent under braccate*.) There are many anatomical characters. (See *Striges*.) Owls are among the most nearly cosmopolitan of birds. They feed entirely upon animal substances, and capture their prey alive, as small quadrupeds and birds, various reptiles, fishes, and insects. They lay

from three to six white eggs of subspherical shape. There are about 200 species, assigned to some 50 modern genera, and now usually considered as constituting 2 families, *Atuconidae* and *Strigidae*, or barn-owls and other owls. See cuts under *barn-owl*, *Bubo*, *Glaucidium*, *hawk-owl*, *Nyctala*, *Otus*, *snow-owl*, and *Strix*.

2. A variety of the domestic pigeon: so called from its owl-like physiognomy. The head is round, and the beak very short. There are several strains of owls, known as English, African, and Chinese. All run in various colors.

The *owls* are African, English, and Chinese. The African is at home in Tunis, whence many thousands have been sent to England, and of which scarcely dozens remain. The bird is the smallest of the family, and so delicate that its term of life out of African air is very limited. The English *owl* is fair in size, with eye round and prominent, the dewlap well developed, and the frill extending to the lower point of the breast. In the Chinese this frill-feathering is excessive, even extending up about the throat to the eyes.

The Century, XXXII. 107.

in the natural state as a *bull*, whose female is a *cow*, and whose young is a *calf*; in a wider sense, an animal of the family *Bovidae* and sub-family *Bovina* or *Oribovina*; a bovine. The several animals of this kind have each of them specific designations, as *buffalo, bison, aurochs, zebu, musk-ox*, etc.: the word is commonly restricted to the varieties of *Bos taurus*, the common ox, which is one of the most valuable of domestic animals. Its flesh is the principal article of animal food, and there is scarcely any part of the animal that is not useful to mankind: the skin, the horns, the bones, the blood, the hair, and the refuse of all these, have their separate uses. Having been specially domesticated by man from a stock which it is probably impossible to trace, the result has been the formation of very many breeds, races, or permanent varieties, some of which are valued for their flesh and hides, some for the richness and abundance of their milk, while others are in great repute for both beef and milk. Among the first class may be mentioned the Durham or shorthorn, the polled Aberdeen or Angus, and the West Highland or kyloe. Among the most celebrated for dairy purposes are the Jersey, Guernsey, Holstein-Friesian, Ayrshire, and Suffolk dun. For the purposes both of the dairy-farmer and of the grazer, the Hereford and a cross between a shorthorn and an Ayrshire are much fancied. The ox is used in many parts of the world as a beast of draft. The "wild ox," now surviving in only a few parks, as at Chillingham Park in Northumberland, and at Cadzow Forest in Lanarkshire, seems, whatever its origin, to have been formerly an inhabitant of many forest-districts in Great Britain, particularly in the north of England and the south of Scotland.

2. In a restricted sense, the castrated male of *Bos taurus*, at least 4 years old and full-grown or nearly so. (See *steer*.) Such animals are most used as draft-animals and for beef.—**Galla ox**, the sanga, a kind of ox found in the Galla country. *Hamilton Smith*.—**Indian ox**, the brahmin bull.—**To have the black ox tread on one's foot**, to know what sorrow or adversity is.

The flowers are yellow, pink, or white, usually in long-stalked umbels, with additional minute

chem., a compound of oxygen with another element. The oxids are grouped as acid-forming, basic, or neutral. The acid-forming oxids, also called *acid anhydrides*, are compounds of oxygen with negative or acid radicals. Chemical ſymbol, O; atomic weight, 16. An element diſcovered by Priſtley in 1774, who called it *dephlogiſticated air*. It was finally called *oxygen* by Lavoisier, becauſe ſuppoſed to be preſent in all acids. Further investigation, however, has proved that this is not the caſe. Oxygen is a chemical element exiſting as a permanent gas, colorleſs, odorleſs, and taſteleſs, and ſomewhat heavier than atmospheric air. It is ſoluble in water, which at a temperature of 60° F. diſſolves $\frac{1}{35}$ of its volume of oxygen. Oxygen combines very readily with moſt of the elements, and forms oxidſ with all of them excepiing fluorin. The act of combination is ſo energetic in many caſes as to evolve light and heat, the phenomena of combuſtion. In other caſes, as in the tarniſhing or ruſting of metals and the decay of animal or vegetable ſubſtances, oxidation takes place ſo ſlowly that, while the reſult is the ſame, the heat evolved at one time is not enough to produce luminous effects or even to be ſenſible. Free or uncombined oxygen is eſſential to all animal and vegetable life. Animal heat and muſcular energy are reſults of a ſlow combuſtion produced in all parts of the ſyſtem by oxygen carried in the blood from the lungs. In ſunlight oxygen is exhale by growing plants, but a certain quantity is aſſimilated and is eſſential to life. Oxygen is the moſt widely diſtributed and abundant element in nature; it conſtitutes about one fifth of the total volume of the atmosphere, which is a mechanical mixture of oxygen and nitrogen. Water contains about 89 per cent. of it by weight, and it is found in moſt animal and vegetable products, acids, oxidſ, and ſalts. The rocks which make up moſt of the earth's cruſt contain between 40 and 50 per cent. of oxygen. Under certain conditions oxygen may be made to paſs into an allotropic or condensed form called *ozone*.

It was Lavoisier who gave to this curious kind of air or gas the name of *Oxygen*, by which it is now univerſally known; and it was he, too, who firſt ſhewed, by the moſt concluſive experiments, what was really the compoſition of atmospheric air. His determination of the conſtitution of the air was made in the year 1777.

An edible bivalve mollusk of the family**

A Fossil Oyster, *Ostrea longirostris*.

Ostreidae, such as *Ostrea edulis*, the common species of Europe, and *O. virginica*, that of the Atlantic coast of the United States. The species are very numerous, and are found in all temperate and tropical countries, in salt and brackish water; there are also many fossil species. The shell is very irregular, both inequivalve and inequilateral, with one valve flattened and the other more concavo-convex, both rough outside and nacreous inside. Each valve has one purplish eye or spot, showing where the single adductor muscle is attached, oysters being thus monomyarian. The gristly button-shaped body in the flesh is this ligament. The soft greenish substance corresponds to a liver. The futed layers around a part of the body are the gills or breathing-organs. Oysters have sex, and are very prolific. They spawn in north temperate countries in May and June, during which period and for some time afterward they are not so good for food; whence the common saying that oysters are not eatable in those months which have no *r* in their names. The spawn or fry is called *spat* or *spet*. Oysters are now very extensively cultivated, the resulting stock being superior to the natural oyster. Starfishes and some carnivorous gastropods (see *borer*) are among the great obstacles to success with which oyster-culture has to contend. Oysters feed upon a great many different aquatic organisms of minute size. In confinement they eat corn meal greedily. See cuts under *ciborium*, *integropalliate*, and *Ostrea*.

[Slang.]—A **choking** or **stopping oyster**, a reply that leaves one nothing to say, as if choked with an oyster too large to swallow.

At an other season, to a feloe laying to his rebuke that he was ouer deintie of his mouthe and diete, he did with this reason giue a *stopping oyster*.

These oysters are of small size, but very delicate and well-flavored.—**Box oyster**, an oyster from seven to ten years old, of handsome round shape, not less than three inches wide and five inches long. It is the second grade in the New York market, inferior to Saddlecock, and superior to cullings and bushel oysters. Same as *cockscomb*, 3.—**Cove oyster**. (a) A name of oysters growing singly in or scattered over coves, creeks, bays, old planting-grounds, etc., too sparsely to be taken by the ordinary method of tonging, but captured singly in from four to eight feet of water with nippers. They have many fanciful local names.—**Reef-oyster**, an oyster growing naturally on reefs; a reef. [Alabama to Texas.]—**Saddlecock oyster**, the first or largest grade of oysters in the New York market. The oysters that first bore that name were taken from a rock so called in Little Neck Bay, Long Island, the supply from which was soon exhausted.—**Sand-oysters**, oysters which have been scattered and exposed or damaged on sand-shoals; *sanded oysters*.—**Shrewsbury oysters**, oysters from Shrewsbury river, New Jersey.—**Single oyster**, an oyster which becomes detached from the bunches after two years' growth; hence, a grown or merchantable oyster.—**Soft oyster**, the oyster obtained from the Chesapeake and southward; distinguished from the *hard* or native northern oyster.—**Thorny oysters**, bivalves of the genus *Spondylus*.—**Tonged oysters**, oysters taken with the tongs; they are preferred to those which are dredged.—**Vegetable oyster**. Same as *oyster-plant*, 2.—**Wild oyster**, an oyster of natural growth, neither artificially propagated nor transplanted.—**Window oysters**, the *Platynidae*. See cut under *Placuna*. ozone (ô-zôn), *n.* [= F. *ozone*; < Gr. *ôzôn*, smell, + *-one*.] A modification of oxygen, having increased chemical activity; a colorless gas having a peculiar odor like that of air which contains a trace of chlorine. The density of ozone is one and one half times that of oxygen. It is produced when the electric spark is passed through air or oxygen, when a stick of phosphorus is allowed to oxidize slowly, and in various other ways. At a high temperature ozone is changed into ordinary oxygen, two volumes of the former yielding three volumes of the latter. Chemical tests show that ozone exists in the atmosphere to a minute extent, and in greater quantity in country districts than in towns, while in crowded thoroughfares it ceases to be recognizable. Ozone has a great power of destroying offensive odors, and is a powerful bleacher and an intense oxidizer.

The proportion of ozone in the air stands in a direct relation to the amount of atmospheric electricity present. *Roscoe and Schorlemmer, Chemistry*, 1. 200.

ozonoscope (ô-zô-nô-skôp), *n.* [*Ozone* + Gr. *σκοπεῖν*, view.] A test-paper which is oxidized and discolored by ozone. When properly exposed, the degree of discoloration indicates the relative amount of ozone in the air. Ozone-papers are usually either red litmus-paper dipped in a dilute solution of potassium iodide, or paper saturated with a mixture of potassium iodide and starch. In the litmus-paper the ozone decomposes the potassium iodide and combines with the potassium, forming potash, by which the red litmus is rendered blue. In the iodized starch-papers, the ozone combines with the potassium, and the free iodine combines with the starch, forming a blue iodide of starch.

1. The sixteenth letter and twelfth consonant of the English alphabet, having a corresponding position in other alphabets. The scheme of parallel forms, as given in the case of the other letters (see especially *A*), is as follows:

The usual Greek Π was made by extending the originally short second perpendicular limb; the Latin (whence our *P*), by curving the same around to meet the perpendicular (see *I*). *P* in all these alphabets stands for the same unvarying sound; namely, for the surd labial mute (corresponding to *b* as sonant, and *m* as nasal), made with closure of the lips, during the maintenance of which closure there is complete silence, its character being brought to light by explosion upon the following sound. The *p*-sound is in English much less common (below a third) than the *t*-sound, and slightly less common (about four fifths) than the *k*-sound. The character *p* has no varieties or irregularities of pronunciation in English save as it is silent at the beginning of a few Greek words, as *psalm*, *pneumatic*, *pteropod*, and, much more rarely, elsewhere, as in *receipt*, *accompt*. It enters into one important digraph, namely *ph*, found in numerous words of classical origin, and pronounced as *f* (but originally as written, or as aspirated *p*, a *p* with an audible *h* after it, as in our compound *uphill*). (See *ph*.) According to the general law of correspondence, a *p* in the Germanic part of our language should represent an original *b*; but *b* appears to have been almost altogether wanting in the primitive language of our family; and hence our *p*, when not of classical origin, or borrowed from elsewhere, is the result of some irregular process.

2. As a medieval numeral, 400; with a dash over it (\overline{P}), 400,000.—**3.** As a symbol: (*a*) In *chem.*, the symbol for *phosphorus*. (*b*) In *math.*, the Greek capital Π denotes a continued product.

Thus, $\Pi_p (1 + p)$, for which $\Pi (1 + m)$ is also written, denotes the product $(1 + m) m (m - 1) \dots 3.2.1$. The small Greek letter π denotes the ratio of the circumference to the diameter, or $3.14159265359 +$. This notation was introduced by Euler. The other form of the Greek minuscule, α , denotes in astronomy the longitude of the perihelion.

(b) Tubes of lead or other soft metal filled with some vegetable material, such as hemp or cotton. The ends of the tubes are either forced or soldered together.—**Oil-well packing**, a packing inserted between the pipe and the interior surface of the boring in an oil-well to keep surface-water, or water from the sides of the hole, from running into the well, and to prevent oil in some wells from being forced out around the pipe by a pressure of gas. The packing originally used was a leather bag filled with flaxseed, called a *seed bag*, made in the form of a ring. The flaxseed, swelling on being wetted, closed tightly the opening to be stopped. This packing swelled so tightly as to be very difficult to remove—a difficulty which led to the invention of many substitutes. One of these is the modern water-packing, which consists of an annular leather packing, concave on the upper surface, surrounding the pipe, and held in position by a screw-joint. The weight of the superincumbent water presses this packing closely against the interior of the bore. Another form of oil-well packing, which stops efflux of oil under internal gas-pressure, as well as influx of surface-water, is shown in the accompanying cut.

Oil-well Packing.

According to the position of the long in the first, second, third, or fourth place respectively, the foot assumes four forms, distinguished as *first pæon* (— — — —), *second pæon* (— — — —), *third pæon* (— — — —), and *fourth pæon* (— — — —). The pæon has a magnitude of five more or primary times (i. e., is pentasemic), its resolved form being the pentabrach (— — — —). Three of these times belong to the thesis and two to the arsis, or vice versa (— — — —), so that the pæon belongs to and is the type of the hemiolic or pæonic class of feet. Only the first pæon and the fourth pæon were in use in pæonic verse, the contracted form, known as the *cretic*, being, however, more common; the second and third occurred in verses analyzed by the ancients as mixed Ionic, or epionic. The *cretic* (— — — —) was sometimes known as the *pæon diagenos*, as distinguished from the *pæon epibatus* (— — — —), in which each short of the pentabrach was doubled (i. e., is represented by a long). The pæon received its name from its original use in compositions in honor of Apollo (see *pæan*). See *diagenos, epibatus*. Also spelled, less correctly, *pæan*.

In the first pæon, an equivalent of the cretic, an arsis consisting of a long and short is followed by a thesis consisting of two shorts. *J. Hadley*, Essays, p. 98.

Meuint [I find] in the writings that among the *paenes* the prestes that lokeden chastete in the temple weren to-deld fram the othren that hi ne loren hire chastete.
Ayenbite of Ineyt (E. E. T. S.), p. 235.

The Christian Church fixed itself first in the seats and centres of intelligence, in the towns and cities of the Roman Empire, and in them its first triumphs were won; while long after these had accepted the truth, heathen superstitions and idolatries lingered on in the obscure hamlets and villages of the country; so that *pagans* or villagers came to be applied to all the remaining votaries of the old and decaying superstitions, inasmuch as far the greater number of them were of this class. The first document in which the word appears in this its secondary sense is an edict of the Emperor Valentinian, of date A. D. 365. The word "heathen" acquired its meaning from exactly the same fact, namely, that at the introduction of Christianity into Germany the wild dwellers on the "heaths" longest resisted the truth.

Thou seem'st 'a *palace*
For the crown'd Truth to dwell in.

Shak., *Pericles*, v. 1. 122.

Equally time-honoured is the use of the word *palace* to describe an English bishop's official residence. Yet there seems to be a feeling among the present bishops that it would be well to abandon it, and in one case (Lichfield) this has been done. *N. and Q.*, 7th ser., IX. 78. Hence—2. A magnificent, grand, or stately dwelling-place; a magnificent mansion or building.

To a riche Cite hi hath iume,

These markings were supposed to represent some kind of seaweed. Some of the Lower Silurian fossils included in the genera *Palaeochorda*, *Palaeophycus*, *Scolithus*, etc., are considered to be the tracks or burrows of worms. Their nature and affinities are extremely doubtful.

The genus *Palaeophycus* of Hall includes a great variety of uncertain objects, of which only a few are true Algae. Dawson, Geol. Hist. of Plants, p. 33.

The ferns included in this genus differ from the living *Adiantum* in some details of fructification, and under the name of *Palaeopteris* are included species previously referred by authors to the genera *Cyclopteris*, *Sphenopteris*, *Nagevathia*, and others. Palaeornis (pā-lē-ōr'nis), *n.* [NL., < Gr. *παλαιός*, ancient, + *ὄρνις*, a bird.] The typical genus of *Palaeornithinae*, founded by Vigors in 1825; so called because some bird of this kind was known to the ancients of Greece and Rome. One species was named by Linnaeus *P. alexandri*, on the supposition that it was that mentioned by Onesicritus, a historian of Alexander the Great. These birds are known as *ring-parrots*, from the characteristic collar around the neck. *P. torquatus* is the common ring-parrot of India, in parts of which country it abounds, sometimes in flocks of thousands. This appears to be the bird often figured as an attribute or accessory of some of the Hindu goddesses in sculpture and painting, like the owl of Minerva or the dove of Venus. *Palaeornis* is the largest as well as the name-giving genus of its group, with upward of 20 species, inhabiting chiefly the Oriental regions, but also Africa. The general color is green, the bill waxy-red in the male, the lores feathered, the tail long and cuneate, the wings pointed, and the form rather lithe. The voice is very loud and harsh, but the birds may be taught to talk a little, and prove tractable in confinement. See cat under *ring-parrot*.

Palaeornithidae (pā'le-ōr-nith'i-dē), *n. pl.* [NL., < *Palaeornis* (-ornith-) + *-idae*.] The *Palaeornithinae* elevated to the rank of a family. Palamite (pal'ā-mīt), *n.* [*< Palam(as) (see def.) + -ite.*] One of the followers of Gregory Palamas, a monk of Mount Athos in the fourteenth century. Simeon, abbot of a monastery at Constantinople in the eleventh century, taught that by fasting, prayer, and contemplation, with concentration of thought on the mavel, the heart and spirit would be seen within, luminous with a visible light. This light was believed to be uncreated and the same which was seen at Christ's transfiguration, and is known accordingly as the *Uncreated Light of Mount Tabor*. The doctrine was more carefully formulated and defended by Palamas, who taught that there exists a divine light, eternal and uncreated, which is not the substance or essence of deity, but God's activity or operation. The Palamites were favored by the emperor John Cantacuzene, and their doctrine was affirmed by a council at Constantinople in 1351. They were called by their opponents *Euchites* and *Masalians*. Also *Hesychast*, *Opponents*.

as much in height, with wooden shutters made on the principle of the Venetian blind. It used to be a very common conveyance in India, especially among the European residents, but the introduction of railways and the improvement of the roads have caused it to be almost wholly abandoned by Europeans. In Japan the palanquin is called *norimono*, and is suspended from a pole or beam passing over the top. A similar conveyance called a *kiaoteu* is extensively used in some parts of China; it is, however, furnished with long shafts before and behind instead of the pole, and is carried by mules. In anat., of or pertaining to the palate; palatine: as, *palatal arteries, nerves, muscles*; the *palatal plate* of the maxillary bone. Also *palatial*.—2. Uttered by the aid of the palate, as certain sounds. See II., 2.—**Palatal glands, index.** Same as *palatine glands, index* (which see, under *palatine* 2).

II. *n.* 1. A palatine bone or palate-bone proper, one of a pair, right and left, of facial bones entering into the formation of the hard palate. They exhibit the utmost diversity of shape and relative size, but preserve constant position and relation in the bony framework of the upper jaw, where they are interposed between the supramaxillary bones in front and the pterygoid bones behind, and thus form an integral part of the preoral visceral arch. In their simplest form, the palatals are mere rods or plates extending horizontally from the pterygoids to the maxillaries. Their connection with the latter is closest, most frequently by fixed suture or ankylosis: with the former it is usually freer, often by movable articulation. There are many modifications of these bones in the lower vertebrates, and in the higher the tendency is to shortening, widening, heightening, and complete fixation, with some connections not acquired in lower animals. Such modifications reach a climax in man, where the palatals have a singular shape somewhat like the letter L, and very extensive articulations with no fewer than five other bones—the sphenoid, ethmoid, supramaxillary, maxilloturbinal, vomer—and with each other. The bone here consists of a horizontal part, or palatal plate, which extends mesad and meets its fellow of the opposite side, thus forming the back part of the bony palate, and of a vertical plate which reaches into the orbit of the eye by a part called the *orbital process*. Each bone thus enters into the formation of the walls of three cavities, of the mouth, nose, and eye; it also assists to form three fossae, the zygomatic, sphenomaxillary, and pterygoid; it bounds part of the sphenomaxillary fissure, and contributes to closure of the orifice of the antrum of Highmore. The bone furnishes attachment in man to the zygomatic muscle, the tensor palati, the superior constrictor of the pharynx, and both internal and external pterygoid muscles. Notwithstanding its complexity of figure and relations, it is a simple or single bone, developed in membrane from one center of ossification. See cuts under *Antra, craniofacial, Crotoles, desmognathous, dromagnathous, Felidae, palatoquadrate, Physeterinae, Python, and sphenoid*.

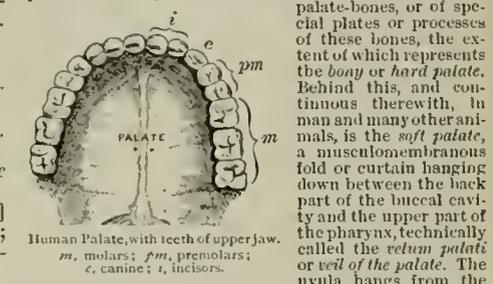

2. A sound usually produced by the upper surface of the tongue against a part of the palate further forward than that at which our *k* and *g* are made; but sometimes used of any sound made between the tongue and any part of the hard or soft palate. Thus, the German *ch* of *ich* is called palatal, and that of *ach* guttural; the Sanskrit has palatal sounds distinguished from gutturals: our *i* and *e* and *y* are called palatal, as also the compound *ch* and *j*. The term is a loose one, and requires definition as used by any authority.

palatalization (pal'ā-tal-i-zā'shon), *n.* [*< palatalize + -ation.*] A making palatal; a conversion (especially of gutturals) into palatal sounds, as of *k* into *ch*, *g* into *j*, *s* into *sh*.

The palatalization of the guttural does not necessitate the coloring of the vowel. Amer. Jour. Philol., VII. 238.

palatalize (pal'ā-tal-iz), *v. t.*; pret. and pp. *palatalized*, ppr. *palatalizing*. [*< palatal + -ize.*] To make palatal; change from a guttural to a palatal pronunciation.

palate (pal'āt), *n.* [*< ME. palat, palet, < OF. palat, *palet (F. palais, arising from a confusion between palais, palaeae, and *palet, *palé, the vernacular OF. form) = It. palato (cf. Sp. Pg. paladar, < L. as if *palatāre), < L. palatum, rarely palatus, the palate, the roof of the mouth.*] 1. The roof of the mouth and floor of the nose; the parts, collectively considered, which separate the oral from the nasal cavity. Most of the palate has a bony basis, formed of the maxillary bones and palate-bones, or of special plates or processes of these bones, the extent of which represents the bony or hard palate. Behind this, and continuous therewith, in man and many other animals, is the soft palate, a musculomembranous fold or curtain hanging down between the back part of the buccal cavity and the upper part of the pharynx, technically called the *velum palati* or *veid of the palate*. The uvula hangs from the middle of the free edge of this velum, and its sides are continuous with the contracted walls of the passage, called the *pillars* or *arches of the palate*, and constituting the isthmus of the fauces. In osteology the term *palate* is of course restricted to the bony parts. In fishes the palate is that part of the roof of the mouth which corresponds to the palatal bones, behind the vomer and in front of the pharyngeals. See *palatal, n.*, 1, and cuts under *dromagnathous, mouth, nasal, and tonsil*.

In 1777 the two were reunited; in consequence of the treaties of Lunéville (1801) and of Paris (1814-15), Bavaria retained the Upper Palatinate and a portion of the Lower Palatinate west of the Rhine, while the remainder of the Lower Palatinate was divided among Baden, Hesse, Prussia, etc. The Bavarian portions now form the governmental districts of Palatinate and Upper Palatinate.

In birds the arch consists simply of the palate-bone, fixed in front and movably articulated behind with the pterygoid, which latter is also movably articulated with the

Paleozoic, Palæozoic (pāl'lē-ō-zō'ik), a. [= F. *paleozoïque*, < *Gr. παλαιός*, ancient, + *ζωή*, life.] In *geol.*, belonging to or constituting a geological formation characterized by the presence of ancient forms of life: applied to the oldest division of the geological series, beginning with the lowest stratified fossiliferous group, and extending upward to the base of the Triassic, or to the top of the Permian. The grand divisions of the Paleozoic are, proceeding upward or to groups later in age, the Silurian, Devonian, Carboniferous, and Permian. (See these words.) Of these the Permian is much the least important. The other divisions have been designated respectively as the "age of mollusks," the "age of fishes," and the "age of coal or of land-plants." The Paleozoic series may, from a paleontological point of view, be properly separated into two great divisions, a newer and an older. The former embraces the Silurian; the latter, the Devonian, Carboniferous, and Permian. The older Paleozoic is distinguished by the great predominance of graptolites, trilobites, and brachiopods, and by the absence of vertebrates; the newer Paleozoic, by the number and variety of the fishes and amphibia, by the disappearance of graptolites and trilobites, and by an extraordinarily developed flora, largely cryptogamic in character, from which a very considerable part of the coal of the globe has been formed. Rocks of Paleozoic age are spread over wide areas. They are especially important in the eastern and northeastern United States and in the Upper Mississippi valley, in which regions they usually form the surface rock, being covered only with detrital formations of the most recent age. Almost the whole of the bed-rock in New York and Pennsylvania is of Paleozoic age, and here the various groups of this series were studied out by the Geological surveys of those States from 1834 on. To the labors of Sedgwick and Murchison in Wales and western England, carried on at about the same time with the beginnings of the New York and Pennsylvania surveys, is due the larger share of the credit of disentangling the complicated structure of a region where the Paleozoic rocks are extensively developed, and it is there that the materials were obtained for the establishment by Murchison of the Silurian and Devonian systems, which, with the Carboniferous and Permian, form the Paleozoic epoch.

of the Colosseum, baths, triumphal arches, and other secular buildings of the Romans. It has been applied more frequently to palaces and civic buildings than to churches. In the *Palladian* style the Roman orders are employed rather as a decorative feature than as a constructive element, and applied without regard to classic precedent.

3. Chemical symbol, Pd; atomic weight, 106.5. One of the rare metals associated with platinum. It was separated from native platinum by Wollston in 1803, and named after the planet Pallas, which had just before that time been discovered by Olbers. Palladium is dimorphous. It occurs in Brazil native, in minute octahedral crystals; and on the Harz it has been found in small hexagonal plates. It is, however, a decidedly rare substance, and the chief supply comes from the working over of the platinumiferous residus of various mines. It resembles platinum in appearance, but is harder; its specific gravity is 11.4. It fuses more readily than platinum or any other of the so-called platinum metals, melting, as is stated by some authorities, about as easily as wrought-iron. It is both ductile and malleable, and would be a very useful metal if it were not so scarce as to be expensive and irregularly attainable. The graduated surfaces of some astronomical instruments have been made of palladium, a use for which this metal is admirably adapted on account of its color and its unalterability in the air. Alloyed with silver, it has been employed by dentists as a substitute for gold.—*Palladium-gold*. See *porpette*.

One of the planetoids revolving between the orbits of Mars and Jupiter: discovered (the second in the order of time) by Olbers, at Bremen, in 1802. On account of its minuteness, and the nebulous appearance by which it is surrounded, no certain conclusion can be arrived at respecting its magnitude. Its diameter has been estimated at 172 miles, and its period of revolution is 4.61 years. Its light undergoes considerable variation, and its motion in its orbit is greatly disturbed by the powerful attraction of Jupiter.

Pallas iron. A meteorite brought from Siberia by Pallas (see *pallasite*) in 1772. The larger part (about 1,200 pounds) is preserved at St. Petersburg, but fragments have been widely distributed in different museums. 4. To reduce in violence; mitigate; lessen or abate: as, to *palliate* a disease. = *Syn.* *Palliate*, *Extenuate*, excuse, gloss over, apologize for. *Palliate* and *extenuate* come at essentially the same idea through different figures: *palliate* is to cover in part as with a cloak; *extenuate* is to thin away or draw out to fineness. They both refer to the effort to make an offense seem less by bringing forward considerations tending to excuse; they never mean the effort to exonerate or exculpate completely. They have had earlier differences of meaning, and *palliate* has a peculiar meaning of its own (see def. 3); *palliate* also would be likely to be used of the more serious offense; but otherwise the words are now essentially the same.

palliate (pal'i-ät), *a.* [*<* L. *palliatas*, cloaked: see *palliate*, v.] 1. Eased; mitigated.

Cardinal Pole, in that act in this queen's [Mary's] reign to secure abbey-lands to their owners, . . . did not, as some think, absolve their consciences from restitution, but only made a *palliate* cure, the church but suspending that power which in due time she might put in execution.
Fuller, Ch. Hist., VI. v. 3.

The nation was under its great crisis and most hopeful method of cure, which yet, if *palliate* and imperfect, would only make way to more fatal sickness.

1. In *Rom. antiq.*, a voluminous rectangular mantle for men, corresponding to the Greek *himation* (see *himation*), and considered at Rome, because worn by Greek savants, as the particular dress of philosophers; also, a toga or other outer garment; a curtain, etc., of rectangular shape.—2. *Eccles.*: (a) In the early church, a large mantle worn by Christian philosophers, ascetics, and monks. (b) A vestment worn by certain bishops, especially patriarchs and metropolitans.

It seems to have come first into use in the Eastern Church, where it is known as the *omophorion*, and to have been worn by patriarchs, and given by them to metropolitans. Some authorities think that it was of primitive origin and at first worn by all bishops, while others hold that it was originally an imperial garment, bestowed by the emperor as a mark of distinction upon patriarchs and others, and afterward given to metropolitans and bishops generally. It has always been of wool, as indicating the pastoral office. It seems at first to have been a mantle rolled together and passed round the neck so as to fall both in front and at the back. It then became contracted in width and was worn nearly as it still is in the Greek Church, as a wide woollen band fastened round the shoulders and descending nearly to the feet. In the Latin or Roman Catholic Church it gradually assumed a different shape, and is now a narrow band like a ring, passing round the shoulders, with two short vertical pieces, falling respectively down the breast and the back. It is ornamented with crosses, and has three golden pins by which it is attached with loops to the chasuble. The pallium was worn anciently in the Western Church by the Pope and by Gallican metropolitans. From the sixth cen-

tury it began to be given by the Pope to some metropolitans outside of his own diocese, in sign of special favor or distinction—at first, according to some authorities, only with approval of the emperor. By the seventh or eighth century it came to be regarded as a sign of acknowledgment of papal supremacy. At present, in the Roman Catholic Church, a bishop elected or translated to a see of metropolitan or higher rank must beg the Pope for the pallium, and receives it after taking an oath of allegiance to the Pope. The Pope wears it whenever he officiates, bishops only on certain great feasts. Anglican archbishops no longer wear the pallium since the Reformation, but it forms part of the heraldic insignia of the archbishops of Canterbury, Armagh, and Dublin. Also called *pall*. (c) An altar-cloth; a frontal or pall.—3. In *conch.*, the mantle, mantle-flap, or mantle-skirt of a mollusk, an outgrowth of the dorsal body-wall. It is a specialized, more or less highly and very variously developed integument, including epithelial, vascular, glandular, and muscular structures, and forming folds or processes which represent the foot and other parts. It is often wanting. See cuts under *Lamellibranchiata*, *Pulmonata*, and *Tridacnidae*.

4. In *ornith.*, the mantle; the stragulum; the back and folded wings together, in any way distinguished, as by color in a gull, etc.—5. A cirro-stratus cloud when it forms a uniform sheet over the whole sky.

M. Poëy has proposed the name of *Pallium*, but this term has not met with general acceptance.

pall-mall (pel-mel'), *n.* [Formerly also *palle-malle*, *pallmaill*, *pallemaill*, *paillmail*; also, in more recent spelling, *pell-mell*; < *OF. pall-mail*, *pallemaill*, *pallemaill*, *pallemaill*, *paillmail*, *paillmaill*, etc., = *Sp. palamallo* = *Pg. palumatha*, < *It. palamaglio*, *pallamaglio*, the game of pall-mall, lit. 'ball-mallet,' < *palla*, ball (< *ML. palla*, ball, < *OHG. palla*, *MHG. G. ball*: see *ball*¹), + *maglio*, < *L. malleus*, a mallet: see *mall*¹.] 1. A game, formerly played, in which a ball of boxwood was struck with a mallet or club, the object being to drive it through a raised ring of iron at the end of an alley. The player who accomplished this with fewest strokes, or within a number agreed on, was the winner.

To St. James's Park, where I saw the Duke of York playing *pelemelle*, the first time that ever I saw the sport. *Pepps, Diary*, April 2, 1661.

The game might develop into golf or *pell mell*. . . . If the point played to was a hole in the ground, golf arose; if you played to a stone, tree, or rock, or through an iron hoop elevated on a post, *pell mell*, *jeu de mail*, *Pila Malleus* was the result. . . . Lauthier describes the attitude and "swing" at *pell mell* in words that apply equally well to golf. . . . Generally speaking, the aim was to "loft" the ball, in fewer strokes than your adversary took, through an elevated iron ring.

A. Lang, Golf (Badminton Library), pp. 4, 11.

2. The mallet used in this game.

If one had *palle-mails* it were good to play in this alley, for it is of a reasonable good length, straight, and even.

Fr. Garden for Engl. Lad. (1621). (*Nares*.)

3. A place where the game was played. The game was formerly practised in St. James's Park, London, and gave its name to the famous street called *Pall Mall* (locally pronounced *pel-mel'*).

In the pavilion of ye new Castle are many faire rooms, well paynted, and leading into a very noble garden and parke, where is a *pall-mall*, in ye midst of which, on one of the sides, is a chapel. *Evelyn, Diary*, Feb. 27, 1644.

E. fumble*, *q. v.* Hence *ult. palm*².] 1. The flat of the hand; that part of the hand which extends from the wrist to the bases of the thumb and fingers on the side opposite the knuckles; more generally and technically, the palmar surface of the manus of any animal, as the sole of the fore foot of a clawed quadruped, as the cat or

mouse, corresponding to the planta of the pes or foot. In man the palm is fleshy, and presents two special eminences, the *thenar* (ball of the thumb) and, opposite to it, the *hypothenar*, mainly due to the bulk of the subjacent muscles. The habitual tendency of the fingers in grasping and holding throws the skin into numerous creases, several principal ones being quite constant in position. The character of these creases, in all their detail and variation in different individuals, is the chief basis of chiromnomy or palmistry. See phrases under *line*².

3. A lineal measure equal either to the breadth of the hand or to its length from the wrist to the tips of the fingers; a measure of length equal to 3 and in some instances 4 inches; among the Romans, a lineal measure equal to about 8½ inches, corresponding to the length of the hand.

palm² (pām), *n.* [*< ME. palme*, < *AS. palm* = *OS. palma* = *D. palma* = *MLG. palme* = *OHG. palma*, *MHG. G. palme* = *Teel. palmr* = *Sw. palm* = *Dan. palme* = *F. palme* = *Sp. Pg. It. palma*, < *L. palma*, a palm-tree, palm-branch, the topmost branch, any branch, a palm-branch as a symbol of victory, also the fruit of the palm, a date, also the name of several other plants; so called from the resemblance of the

leaves of the palm-tree to the outspread hand; < *palma*, the palm of the hand: see *palma*¹. The Gr. name of the date-palm was *φοινίξ*: see *phoenix*.] 1. A tree or shrub of the order *Palmæ*. The palms form a natural plant-group of great interest, in appearance highly picturesque and often elegant, and in usefulness surpassed by no family except the grasses. The pulpy fruit of some species, most notably of the date, and the seed-kernel of others, preëminently the cocconut, are edible. Oil is yielded by the fruit-pulp of some (oil-palm) and by the seeds of others (cocoanut, bacaba, etc.). The pith of the sago-palms is farinaceous, and the large terminal bud of the cabbage-palm serves as a vegetable, as do the young seedlings of the palmyra. The sap of the wild date-tree and other species yields palm-sugar or jaggery; that of the coquito, palm-honey. The juice of various species becomes toddy or palm-wine, which in fermenting serves as yeast, and distilled affords a spirituous liquor. Aside from food and drink, the betel-nut, a kind of catechu, and a kind of dragon's-blood are palm-products; a candle-wax exudes from *Ceroxylon*; vegetable ivory is the nut of the ivory-palm. Palm-wood is useful for building (date-palm, palmyra, etc.), for fine work (porcupine-wood), for piles (palmetto), and for flexible articles (rattan). The leaves of many species serve for thatching (bussu-palm, royal palmetto, palmyra, etc.), for making hats, baskets, and fans, and in place of paper (palmetto, tatipot, etc.). The leafstalks of some (kitnl, piassava) furnish an important fiber, as also does the husk of the cocconut. There are many other uses. The cocconut, date-, and palmyra-palms lead in importance. The palm of the Bible is the date-palm. (For symbolic use, see def. 2.) As ornamental plants in temperate regions the palms are indispensable where sufficient hothouse room can be had.

The *palme* eke nowe men setteth forth to stande.

Breadths of tropic shade and palms in cluster, knots of Paradise.
Tennyson, Locksley Hall

2. A branch, properly a leaf, of the palm-tree, anciently borne or worn as a symbol of victory or triumph; hence, superiority; victory; triumph; honor; prize. The palm was adopted as an emblem of victory, it is said, because the tree is so elastic as, when pressed, to rise and recover its correct position. The Jews carried palm-branches on festal occasions, and the Roman Catholic and Greek churches have preserved this usage in celebrating the entry of Christ into Jerusalem. See *Palm Sunday*. See also def. 3.

And come to the place where ye anngell of our Lord brought a *palme* vnto our blessyd Lady, shewyng vnto her yre daye of her dethe. *Sir R. Guylford*, Tydrymage, p. 32.

It doth amaze me

In clearest judgments, as to invent or make.
B. Jonson, Poetaster, v. 1.

3. One of several other plants, popularly so called as resembling in some way the palm, or, especially, as substituted for it in church usage. Among plants so designated are, in Great Britain, chiefly the great willow or goat-willow, *Salix caprea*, at the time when its catkins are out, and the common yew (the latter is universally so called in Ireland); in Europe also the olive, holly, box, and another willow; and in the northern United States the hemlock-spruce.

Palmae (pal'mä), n. pl. [NL. (Linnæus, 1737), pl. of L. *palma*, a palm.] The palm family, an order of monocotyledonous plants of the series *Calyceæ*, characterized by the one- to three-celled free ovary, solitary ovules, and small embryo immersed in a little hollow near the outside of the hard or oily albumen. About 1,100 species are known, classed in 129 genera, 7 tribes, and 18 subtribes. They are mainly tropical, especially American, and are most abundant on coasts and islands; fewer in Asia and Australia; fewest in Africa; reaching lat. 44° N. in Europe, 36° in America, 34° in Asia. The species are usually local, excepting the cocconut and four or five others. They are trees or shrubs, mostly unbranched, generally perennial, and continued only by a terminal and sometimes edible bud. Their large leaves are pinnately or radiately parallel-veined, undivided and plaited in the bud, divided slightly or completely on expansion. The flowers are small, regular, often rigid or fleshy, often dioecious, usually with six stamens, borne on a branching spadix, with several or many sheathing bract-like or woody spathe. The fruit is a berry or drupe or dry fruit, the outside commonly fibrous, within membranous, crustaceous, woody, or stony. The cells are surrounded with a thick integument, which is generally soon confluent into a shapeless mass of jelly; multiplication is mostly by division. The forms included in this genus are probably not autonomous, but represent arrested polymorphous forms which multiply rapidly by the process of cell-multiplication, without developing, for a protracted period, the true plant. The particular plants, however, to which they belong have never been determined.—**Palmella stage**, or **palmella condition**, a general phrase sometimes applied to certain of the lower algae which exhibit the peculiar gelatinous masses described above. In the *Schizocytetes* this condition or stage has lately been called the *zoogloea stage*. See *Zoogloea*.

The distinction between *pilgrim* and *palmer* seems never to have been closely observed.

palmerin (pal'mēr-in), *n.* [**< Palmerin** (see *def.*).] One of a line of romantic heroes of the age of chivalry, who took their names or their titles from Palmerin de Oliva, an illegitimate grandson of a Greek emperor of Constantinople. This Palmerin derived his name from the circumstance of his exposure in a wicker basket on a mountain-side among palms and olive-trees in Spain. He afterward became famous for his exploits in Germany, England, and the Orient. The exploits of the Palmerins, as celebrated in the famous Spanish romances called by their name, are evidently modeled after those of Anadid of Gaul. In literature the name is often applied as a term of distinction to any redoubtable champion of the age of chivalry.

That brave Rosicler
That damned brood of ugly giants slew,
And *Palmerin* Franconar overthrew.
Beau. and *PL.*, Knight of Burning Pestle, iii. 2.

The oldest ballads tell us nothing at all . . . of the *Palmerins*, nor of many other well-known and famous heroes of the shadow-land of chivalry.
Ticknor, *Span. Lit.*, I. 119.

palmer-worm (pā'mēr-wōrm), *n.* [**< palmer² + worm**.] 1. A caterpillar; especially, a hairy caterpillar injurious to vegetation, but what kind is unknown or undetermined. The name occurs three times in the Bible (Joel i. 4; ii. 25; Amos iv. 9) as the translation of the Hebrew *gāzum*, rendered in the Septuagint κάμπη and in the Vulgate *eruca*. Some have supposed it to be a destructive kind of locust, as *Pachytelus migratorius*; but in Joel the name is expressly distinguished from "locust." The Hebrew name is referred to a root meaning "to cut off"; the Greek κάμπη refers to the bending or looping of some caterpillars, apparently pointing to a looper or measuring-worm—that is, the larva of some geometrid moth; and the Latin *eruca* may have the same significance. The destructiveness of many of these geometrids would fully bear out the Biblical implication. See *oubit*.

There is another sort of these Catterpillars, who have no certain place of abode, nor yet cannot tell where to find their food, but, like unto superstitious Pilgrims, do wander and stray hither and thither, (and like Mice) consume and eat up that which is none of their owne; and these have purchased a very apt name amongst vs Englishmen, to be called *Palmer-worms*, by reason of their wandering and roghish life (for they never stay in one place, but are ever wandering), although by reason of their roghness and ruggednes some call them *Beare-wormes*. They can by no means endure to be dyeted, and to feede upon some certaine herbes and flowers, but boldly and disorderly creepe over all, and tast of all plants and trees indifferently, and live as they list.
Topseil, *History of Serpents* (1608), p. 105.

That which the *palmerworm* hath left hath the locust eaten.
Joel i. 4.

The one most properly so called is *Sabal Palmetto*, the cabbage-palmetto, a tree from 20 to 35 feet high, abounding on the southeast coast of the United States. It forms part of the device in the seal and flag of South Carolina, the Palmetto State. Its wood is not attacked by the teredo and is very durable under water, and is therefore much used for piles and wharves. The fibrous leaves of this and the dwarf palmetto, *S. Adansoni*, are made into hats, baskets, and fans, and also furnish an upholstery material. The palmetto, or hennip-palm, of southern Europe and North Africa, is *Chamærops humilis*, a dwarf species, affording abundant fiber, consumed chiefly as "vegetable horsehair." The same names are given to the Chi-

Palmetto.—Fragment of Frieze, Acropolis of Athens.

Called in the West Indies *royal palmetto*.—**Silver-top palmetto**, the name in Florida of *Thrinax argentea*, a tree of the same range and size as the last, the leaves silvery-silky beneath. Its uses resemble those of the cabbage palmetto. Also called *brickley* and *brittle-thatch*.—**Small palmetto**, a name of the palm-like genus *Carludovica* of the natural order Cycanthaceae.

The labial palpi are two in number, rising either from the ligula or from the edge of the mentum; the maxillary palpi are placed one on the outer side of each maxilla. Besides these, certain *Coleoptera* have a second two-jointed palpiform appendage on each maxilla, formed by a modification of the galea or external lobe. In the *Lepidoptera* this term is commonly restricted to the large labial palpi, the much smaller maxillary ones being distinguished as *palpuli*. The palpi are supposed by some to be organs of taste or touch. In the spiders the maxillary palpi are greatly developed, forming the pedipalps; these, in the scorpions, become chelate appendages, commonly called the front legs. Small palpi are also developed from the mandibles and maxillæ of certain crustaceans. Dan. pamphlet*, *Sw. pamphlett*, *Russ. pamphletti*, a pamphlet, usually a leaf, are all from *E.* The word has been variously referred—(1) to a supposed OF. **pamne-fucillet*, *< pamne*, palm, hand, + *fucillet*, a leaf (as if 'a leaf of paper held in the hand'); (2) to a supposed ML. **pagina filata*, 'a threaded (sewed) leaf'; (3) to a supposed use of *F. par un flet*, 'by a thread'; (4) to a supposed OF. **pamflet*, ML. **pamphiletus*, *< L. OF. *pampilette* for *papilette*, a spangle; OF. *pompon*, *< L. pepo(n)*, a melon (see *pumpion*); *E. pamp*, *pamper*, as related to *pap*², etc. Cf. also ML. *pampilus*, *pamphinus*, *papulus*, variants of *L. papyrus*, a vine-leaf (see *pampine*, *pampre*); these may have affected the form and sense of *pamphlet*.] 1†. pangensis (pan-jen'e-sis), *n.* [NL., *< Gr. πᾶς (pās), all, + γένεσις, production.*] A provisional hypothesis advanced by Darwin to explain the phenomena of reproduction in organisms. It rests on the assumptions that the organic units (cells) of which an organism is composed differ from one another according to the function of the organ to which they belong; that they undergo multiplication by budding or proliferation, giving rise to minute gemmules, which are diffused to a greater or less extent throughout every part of each organism; that these gemmules possess the properties which the unit had when they were thrown off; and that when they are exposed to certain conditions they give rise to the same kind of cells from which they were derived. The name is also applied to the theory or doctrine that every organism has its origin in a simple cell called a *pangenetic cell*.

I venture to advance the hypothesis of *Pangensis*, which implies that every separate part of the whole organisation reproduces itself. So that ovules, spermatozoa, and pollen-grains—the fertilized egg or seed, as well as buds—include and consist of a multitude of germs thrown off from each separate part or unit.

pantograph (pan'tō-grāf), *n.* [Also *pantograph*; = F. *pantographie* = Sp. *pantógrafo* = Pg. *pantographo* = It. *pantografo*, < Gr. πᾶς (παντ-), all, + γράφειν, write. Also, erroneously, *pentograph*, as if < Gr. πέντε, five, + γράφειν, write.] An instrument for the mechanical copying of engravings, diagrams, plans, etc., either upon the same scale or upon a reduced or an enlarged scale. It consists of four perforated limbs or rules, *a, b, d, e*, of wood or metal, arranged in pairs, jointed together at the crossing, the two pairs being also

Pantograph.

a, b, d, and e are rules perforated with a series of holes placed at graduated distances for adjustment to different scales for enlargement or reduction of the picture to be transcribed; *a* and *b* are permanently but movably jointed at *c* to a traversing support; *d* and *e* are similarly jointed at *h* to a pencil-holder or point-holder; *f, g* are thumbscrews which act as pivots for joining *a* and *d* and *b* and *e*. The rule *a* is pivoted to a support *i* which is fixed to the drawing-table; *g* is a stylus attached to the end of the rule *b*. Lines traced by *g* will be also drawn by *h* on a larger or smaller scale corresponding to the adjustment.

jointed together at *c* and *h*. The perforations are made at uniform distances, in accordance with a scale of measurement. The pivoted joints by which the two pairs are connected are constant, while the joints between the intersecting limbs of each pair may be shifted by inserting the joint-pins *f, f* in different holes in each limb. By changing the pins the copy may be reproduced on any scale either larger or smaller than the original, or it may be kept of the same size, the proportion being indicated for convenience by figures on the limbs (not shown in the cut). In use, the end pivot *i* is fixed to the table, the pivot *c* sliding on the plane surface according to the impulse given to it. The pivot *a* carries a tracing-point which is passed over the original lines to be reproduced, and the pivot *h* carries a pencil or needle which traces the copy or pricks it in the paper. The pantograph is used for transferring patterns to calico-printing cylinders, in some processes of wood-carving, in making wooden type, etc.—**Polar pantograph**, a modification of the pantograph arranged for reproducing profiles of curved figures, as the tread of a car-wheel, the interior of a belt, or any other irregular form. It consists essentially of two arms supported in a light frame and united by means of a rack on each and a pinion common to both, so that the movement of one arm controls that of the other. When the point of the instrument is placed against the tread of a car-wheel, and is moved over it, the other arm reproduces a tracing that is an exact copy of the tread, showing such flattened places as may have resulted from wear, and such other irregularities as are present.

Pg. papel, < L. papyrus, also papyrum (ML. also papyrus), paper made of papyrus, also a garment made from papyrus, prop. the plant papyrus, < Gr. πάπυρος (παπύρος, sometimes παπύρος), the plant papyrus, a kind of rush (see *papyrus*), also anything made of it, as linen, cord, etc. The Gr. word for 'paper' was χάρτης, L. *charta*: see *chart*, *charter*, *card*¹.] **I. n.** 1. A material consisting of a compacted web or felting of vegetable fibers, commonly in the form of a thin, flexible sheet: used in writing, for printing, and for various other purposes. The fibers most used for writing-papers are those of linen and cotton rags, and for printing-papers those of straw, wood, paper-cuttings or paper-waste, and selected grasses. These fibers are prepared by grinding, bleaching, beating, and boiling until they are reduced to a fluid pulp, in which state they readily mat or felt together when freed from the water in which they are suspended. More than 400 varieties of fibers usable for this purpose are known; all have curling filaments that readily interlace with one another. Paper was formerly made wholly by hand, pulp from the vat being dipped up in a mold, from which the water drains away, leaving a felted sheet, which is then pressed and dried. Some fine grades of writing-, printing-, and drawing-papers are still made in this way, but the larger part of the paper, for whatever purpose used, is now made by machinery. For some purposes, as newspaper-printing, the sheet is made in continuous webs of very great length, and is printed from the uncut roll. Paper is made in a great variety of qualities, ranging from heavy drawing-board to the lightest tissue-paper, and in every color and shade. It is cut for the trade by accurate machines in a number of sizes, the sheets varying somewhat according to fashion or special requirements. (See list of sizes given below.) Paper is also molded from the pulp into cartridge-cases, embossed sheets for wall-decoration, pails, boxes, and other vessels, boats, barrels, car-wheels, domes for observatories, bricks, building materials, etc., in all of which lightness is combined with strength. From the sheet it is transformed by various processes and operations into roofing material, carpets, bags, etc. The principal varieties of ordinary paper are—writing- and printing-papers, coarse papers for wrapping and other purposes, and blotting- and filtering-papers; while some useful kinds are the result of manipulations subsequent to the paper-maker's work, as lithographic paper, tracing-paper, etc. The ordinary counts of paper are the quire of twenty-four sheets, the ream of twenty quires (of which two are inferior to the other eighteen), and the bundle of two reams.*

papillette (pap-i-let'), *n.* [OF., also *papilète*, *papillette*, *papillote*, *papillotte*, a spangle, lit. a butterfly; see *papillote*.] Same as *papillette*.

Papilio (pā-pil'ī-ō), *n.* [NL. (Linnaeus), < *L. papilio*(*n.*), a butterfly; whence ult. E. *pavilion*, *q. v.*] 1. [*l. c.*] A general name of all lepidoptera before the introduction of the binomial nomenclature in zoölogy.—2. A notable genus of butterflies: a name variously used. (a) By Linnaeus (1758), for all butterflies then known: equivalent to *Rhopalocera*. (b) By Fabricius (1793), for butterflies of

pean swallowtail, *P. machaon*, as the type species of the genus; Scudder (1872) decides that *P. antiope* is the type. By most entomologists the name is now restricted to swallow-tailed butterflies having ample wings, triangular fore wings, hind wings concave next to the body and usually extended behind into a tail before the anal angle, and outer margin of hind wings dentate, with the teeth quite prominent near the tail. The genus thus defined is of world-wide distribution, with about 350 species. The common yellow and black butterfly of North America, *P. tarnus*, is a good example. Another is the common swallow-tailed butterfly of Europe, *P. machaon*, with long antennae, very short palpi, and the hind wings tailed. This species expands about three and one half inches, is yellow and black, with a red spot at the anal angle. Some of the papilios are giants, as *P. antiope* of Africa, expanding about eight inches. See *Equites*, 2, and also cut under *Papilionidae*.

(Leach, 1819), < *Papilio*(*n.*) + *-idae*.] A family of butterflies, typified by the genus *Papilio*, usually considered the highest of the diurnal *Lepidoptera*, or *Rhopalocera*. They have broad wings erect in repose, the hind wings concave along the abdominal border, slender antennae with the knob straight or scarcely curved, slender body, and six functional legs of which the first pair is of normal size and directed forward. The larvæ are smooth or only moderately pilose, never spinose, thicker in front, tapering behind, with two retractile tentacles on the segment behind the head. The chrysalids are naked, angular, fastened to a button of silk, and hung by a silken loop a little above the middle of the body. The family is divided into 2 subfamilies, *Papilioninae* and *Pierinae*, to which some add *Parnassiinae*. [Other forms of the word are *Papiliones* (Dalman, 1816); *Papilionidea* (Leach, 1815); *Papilionidea* (Latreille, 1802); and *Papilionidi* (Boisduval, 1829).] See also cuts under *Papilio*.

They are few and small in many parts of the body endowed with comparatively little sensibility, but in some places, especially the palmar and plantar surfaces of the hands and feet, and about the nipple of the breast, they are very large and numerous, and set in special curved lines, thus throwing up the cuticle into the many little ridges observable at the tips of the fingers, for example. [*Gr. πάπιρος*, papyrus (paper), + *γραφία*, < *γράφω*, write.] The method or process of reduplicating documents by the agency of a papyrograph: sometimes restricted to such methods as resemble closely those of lithography, but employ a prepared paper or pasteboard instead of lithographic stones.

papyrotype (pā-pī-rō-tīp), n. [*Gr. πάπιρος*, papyrus (paper), + *τύπος*, impression.] A process of photolithography devised by Captain Alney, in which the picture is printed according to usual methods on a sensitized gelatin film supported on paper, and then transferred to a lithographic stone or to zinc by means of an impression in lithographic ink from the moistened film.

papyrus (pā-pī'rus), n.; pl. *papyri* (-rī). [*It. ME. papyre*, < *OF. papyre* (F. *papyrus*) = *Sp. It. papiro* = *Pg. papyro*, < *L. papyrus*, < *Gr. πάπιρος*, the papyrus, a kind of rush formerly growing largely in Egypt (see *def.*). Hence ult. *paper*.] 1. The paper-reed or -rush, *Cyperus Papyrus* (*Papyrus antiquorum*), abounding on marshy river-banks in Abyssinia, Palestine, and Sicily, now almost extinct in Egypt. It afforded to the ancient Egyptians, and through them to the Greeks and Romans, a convenient and inexpensive writing-material. The papyrus was prepared by cutting the central pith of the reed into longitudinal strips, which were laid side by side, with another layer of strips crossing them at right angles. The two layers, thus prepared, were soaked in water, then pressed together to make them adhere, and dried. For books the papyrus was formed into rolls by cementing together a number of sheets. Also called *biblos*.

2. The norm; a standard, fixed either by natural conditions or by consent and agreement.

Its (the barometer's) average height being 29.95 inches at the mean sea level in England on the London parallel of latitude: which height may be called *par* for that level. *Fitz Roy*, Weather Book, p. 15.

Specifically—3. In *banking* and *com.*, the state of the shares of any business, undertaking, loan, etc., when they are neither at a discount nor at a premium—that is, when they may be purchased at the original price (called *issue par*), or at their face-value (called *nominal par*). Such shares or bonds are said to be *at par*. When they may be purchased for less than the issue or nominal *par*, they are said to be *below par*, or at a discount; when the price is greater than the issue or nominal *par*, they are said to be *above par*, or at a premium.

4. Same as *arbitrated par*. See the quotation.

The *par* is a certain number of pieces of the coin of one country, containing in them an equal quantity of silver to that in another number of pieces of the coin of another country: e. g. supposing 36 shillings of Holland to have just as much silver in them as 20 English shillings. *Locke*, Farther Considerations on Money.

Above *par*, at a premium.—**Arbitrated par**, **arbitrated par of exchange**, the amount in the currency of one country which is equivalent at any time to a given amount of a foreign currency. The arbitrated *par* represents the mint *par* as modified by the transient influences of supply and demand and other circumstances of the time and of the particular transaction.—**Below par**, at a discount.—**Issue par**, the price at which a stock or other value is issued to the public, sometimes less than the nominal *par*. Thus, if bonds nominally for \$100 each are issued at \$85, the latter is called the *issue par*.—**Mint par**, **mint par of exchange**, the weight of pure gold or silver in a coin of one country as compared with that in a coin of the same metal of another country.—**Nominal par**, the face-value of a share of stock, etc.—**Par of exchange**, the established value of the coin or standard value of one country expressed in the coin or standard value of another. In stating this *par* of exchange the standard of value of one country may be regarded as fixed, and that of the other variable. Thus, in exchange between the United States and Great Britain, the United States gold dollar may be taken as equal to so many shillings and pence sterling, or, as is more usual, the pound sterling is fixed, and equal to so many dollars and cents United States gold, viz. \$4.84.

(See *ortho*- and *meta*-.) In *biology* it indicates comparison with something else, yet a distinctness or difference therefrom in one of many or various ways. In *pathology* it signifies a condition differing in quality from normal.

parabasis (pa-rab'ā-sis), n. [*NL.*, < *Gr. παραβάσις* (as *def.*), < *παρά*, beside, + *βάσις*, a stepping, step, < *βαίω*, walk, step.] The chief of the choral parts in ancient Greek comedy. It was sung by the chorus, usually divided into four rows of six and moving backward and forward facing the audience, during an intermission in the action, and while the actors were off the stage. It was written for the most part in anapestic tetrameters, and consisted, in fact, of an address from the poet to the public, giving his views and advice on affairs of state, as well as, often, his personal interests and claims for recognition or reward. The parabasis was regularly divided into six rhetorical parts, which were again subdivided; but any of these parts might be omitted or modified. It continued in the fully developed comedy the tradition of the Bacchic processions in which Greek comedy had its origin.

Something similar in purpose to the parabasis was essayed in one, at least, of the comedies of Beaumont and Fletcher, and in our time by Tieck.

Lowell, Study Windows, p. 218.

The distinctive feature of Old, as compared with Middle Comedy, is the parabasis, the speech in which the chorus, moving towards and facing the audience, addressed it in the name of the poet, often abandoning all reference to the action of the play. *Encyc. Brit.*, VII. 407.

Specifically—2. An allegorical relation or representation from which a moral is drawn for instruction; an apologue. It is a species of fable, and differs from the apologue in that it deals with events which, though fictitious, might reasonably have happened in nature. The word is also employed in the English Bible to signify a proverb, a proverbial or notable saying, a thing darkly or figuratively expressed.

Poesie*, p. 205.

parabola² (pa-rab'ō-lā), *n.* [= *F.* *parabole* = *Sp.* *parabola* = *Pg.* It. *parabola*, *κ* *NL.* *parabola*, a parabola, *κ* *Gr.* *παραβολή*, a parabola (see *def.*), so called by Apollonius of Perga, lit. 'superposition,' *κ* *παραβάλλειν*, throw beside, compare; see *parabole*¹.] 1. A curve commonly defined as the intersection of a cone with a plane parallel with its side. The name is derived from the following property. Let the figure represent the cone. Let *ABG* be the triangle through the axis of the cone. Let *DE* be a line perpendicular to this triangle, cutting *BG* in *H*. Let the cone be cut by a plane through *DE* parallel to *AG*, so that the intersection with the cone will be the curve called the parabola. Let *Z* be the point where this curve cuts *AB*. Then the line *ZH* is called by Apollonius the diameter of the parabola, or the principal diameter, or the diameter from generation; it is now called the axis. From *Z* draw *ZT* at right angles to *ZH* and in the plane of *ZH* and *AB*, of such a length as to make *ZT:ZA::BG²:AB.AG*. This line *ZT* is called the latus rectum; it is now also called the parameter. Now take any point whatever, as *K*, on the curve. From it draw *KL* parallel to *DE*, meeting the diameter in *L*. *ZL* is called the abscissa. If now, on *ZL* as a base, we erect a rectangle equal in area to the square on *KL*, the other side of this rectangle may be precisely superposed

Parabola, as formed from cone.

upon the latus rectum, *ZT*. This property constitutes the best practical definition of the parabola. If a similar construction were made in the case of the ellipse, the side of the rectangle would fall short of the latus rectum; in the case of the hyperbola, would surpass it. The modern scientific definition of the parabola is that it is that plane curve of the second order which is tangent to the line at infinity. The parabola is also frequently defined as the curve which is everywhere equally distant from a fixed point called its focus, and from a fixed line called its directrix. The normal to a parabola at every point on the curve bisects the angle between the line parallel to the axis and the line to the focus. See also cuts under *conic*.

Common Parabola, with focus *F* and directrix *AB*.

2. By extension, any algebraical curve, or branch of a curve, having the line at infinity as a real tangent. Such a curve runs off to infinity without approximating to an asymptote. If the branch has an asymptote at one end but not at the other, it is not commonly termed a parabola.—**Bell-shaped, biquadratic parabola.** See the adjectives.—**Campaniform parabola,** a cubic divergent parabola without node or cusp.—**Cartesian parabola,** a plane cubic curve having the line at infinity a tangent at its crunode. See *trident*.—**Cubical or cubic parabola,** a parabola of the third order—that is, such that every line in the plane meets it in three points, one at least real, though it may be at infinity; especially, the curve better described as the *central cubical parabola*, which has a cusp on the latus rectum at infinity, and the normal at its inflection passing through the cusp. There is also a non-plane curve so called.—**Cuspidate parabola,** a parabola having a cusp.—**Divergent parabola,** a plane curve having the line at infinity as an inflectional tangent.—**Double parabola,** a plane curve of the third class, having the line at infinity for a double tangent.—**Helicoid parabola.** See *helicoid*.—**Neilian parabola,** the semicubical parabola, which was rectified, before any other curve, by Wm. Neil in 1657.—**Nodate parabola,** a parabola having a crunode.—**Oval parabola,** a parabola having an oval.—**Plane cubic parabola.** See *cubic*.

parallax (par'ā-laks), *n.* [= F. *parallaxe* = Sp. *paralaje*, *paralajis* = Pg. *parallaxe* = It. *parallasse*, *<* Gr. *παράλλαξις*, alternation, parallax, *<* *παράλλασσεν*, make things alternate, *<* *παρά*, beside, + *ἀλλάσσειν*, change, *<* *ἄλλος*, another.] 1. An apparent displacement of an object observed, due to real displacement of the observer, so that the direction of the former with reference to the latter is changed. In the cut, the angle BCD, being the semidiameter of AB as seen from C, is the parallax of C as seen from B. In astronomy, parallax is due either to our daily motion round the center of the earth, or to our yearly motion round the sun. Parallax is observed, also, when the head is moved before two images or other objects in the region of distinct vision and at unequal distances. There is also an effect of parallax when we alternately shut one eye and open the other.

2. In *optics*, an apparent shifting of the spider-lines in a telescope-reticle as the eye is moved before the eyepiece: it is due to the non-coincidence of the threads with the focal plane of the object-glass.—**Angle of parallax**, in *physiological optics*, the angle which the visual axes form at their point of meeting. This angle becomes greater the nearer the point of fixation.—**Annual parallax**, the displacement of a star owing to its being observed from the earth instead of from the sun.—**Diurnal parallax**, the displacement of a body owing to its being observed from the surface instead of from the center of the earth.—**Horizontal parallax**, the diurnal parallax of a star upon the horizon. The horizontal parallax is equal to the semidiameter of the earth as seen from the star.—**Parallax of altitude**, the angular amount by which the altitude of the moon or other heavenly body is less on account of parallax.

In *geom.*, of lines (according to Euclid in his definition of parallel straight lines), lying in the same plane but never meeting however far they may be produced in either direction; of planes, never meeting however far they may be produced; in modern geometry, intersecting at infinity. The definition of Euclid is the traditional one; but the modern definition has three logical advantages: first, it is not, like the Euclidean definition, a negative one; second, it makes one conception applicable equally to parallel lines and parallel planes; and third, it is a statement which, whether literally true or not, must be admitted in form for the sake of the important generalizations which result from it.

2. Having the same direction, tendency, or course.

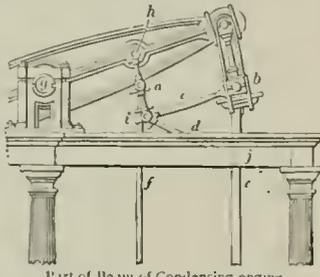

How am I then a villain
To counsel Cassio to this parallel course,
Directly to his good? Shak., *Othello*, ii. 3. 355.

3. Continuing a resemblance through many particulars; like; similar; equal in all essential parts: as, a *parallel* case: *parallel* passages in the Evangelists.

4. In *music*: (a) Of two voice-parts, progressing so that the interval between them remains the same. Such progression is called *parallel motion*, and the intervals by which the two parts are separated are called *parallel intervals*. When the interval is a unison, an octave, or a perfect fifth, the progression is regarded as faulty: such progressions are called *parallel unisons*, *octaves*, or *fifths*, or simply *parallel* or *consecutive*. Parallel thirds and sixths are correct, and pleasing when not too long continued. Parallel seconds and sevenths are rare, and usually objectionable. (b) Of tonalities, same as *relative*.—5. In *entom.*, parallel-sided: as, *parallel* elytra, wings, etc.—**Parallel bars**, battle,

brake-hanger. See *barl*, etc.—**Parallel circles on a sphere**, circles whose planes are parallel.—**Parallel circuit**, an electrical conductor joining two points which are also connected by another conductor, to which the first is then said to be parallel.—**Parallel coping**, in *building*, coping of equal thickness throughout; used to cope inclined surfaces, such as gables, etc.—**Parallel curves and surfaces**, those curves and surfaces which have the same normals, and are therefore everywhere equidistant.—**Parallel extinction**. (a) Defined by Euclid as "straight lines which are in the same plane and, being produced ever so far both ways, do not meet." (b) *Milit.*, same as *parallels*. See II., 5.—**Parallel motion**. (a) A contrivance for converting reciprocating circular motion into rectilinear reciprocating motion by the use of link-work. The ordinary parallel motion, that of Watt, fulfils its function to a close degree of approximation, but not exactly. It is designed to cause the piston-rod in imparting motion to, and the pump-rod in taking motion from, the oscillating beam of a steam-engine, to move respectively in very nearly right lines, and is sufficiently perfect for all practical purposes. It depends upon the principle that when the ends of two levers connected by a link oscillate on different centers in the same vertical plane, describing arcs convex toward each other, there is some point in the connecting-link that must move in nearly a right line. The position of this point depends upon the lengths of the levers and the relative positions of their fulcrums. A method for mathematically locating this point has been given by Rankine. In the diagram the ends of the equal levers *g h* and *i j* describe arcs convex toward each other; *a* is the connecting-link; *g* and *j* are the fulcrums. The piston-rod is connected at *b* to the link *c*; and when the levers are caused to oscillate, one end of the link *a* is drawn to the right, while the other is moved to the left, causing the point of connection, and also the pump-rod *f* and piston-rod *e*, to move in nearly right lines. The first exact parallel motion discovered, after immense labor by many mathematicians, was Peaucellier's cell. (See *cell*.) The simplest is the Kempe-Sylvester parallel motion. (b) *In music*. See *motion*.—**Parallel perspective, rod**, etc. See the nouns.—**Parallel roads**, benches or terraces on hill-slopes, indicating former levels at which the water stood in the valley beneath at a time when this was occupied by a lake, or a lake-like expansion of a river. The phrase *parallel roads* is chiefly used with reference to the so-called Parallel Roads of Glenroy in Scotland, in regard to which there has been much discussion among geologists. See *terrace*.—**Parallel rulers**, an instrument for plotting courses on a chart, or for drawing parallel lines for other purposes. It consists of two rulers connected by cross-bars of equal length, movable about joints, so that while the distance between the two rulers may be increased or diminished, their edges always remain parallel.—**Parallel sailing, sphere**, etc. See the nouns.—**Parallel sulcus**. See *parallel fissure*.

Part of beam of Condensing-engine.

See I., 4.—In *parallel*, a method of connecting electric batteries or dynamos in which all of the positive poles are joined to one extremity of the circuit-wire, and all of the negative to the other. (See *battery*.) The connection is said to be in series when the positive pole of one cell or machine is joined to the negative of the next.—**Mundane parallel**, in *astron.*, situation at equal distances from the meridian.—**Parallels of altitude**, in *astron.*, small circles of the sphere parallel to the horizon. Also called *almucantaras*.—**Parallels of declination**, small circles of the celestial sphere parallel to the equator.—**Theory of parallels**, the geometrical discussion of the number of lines which can be drawn through a given point parallel to a given line, with other kindred matters. The fifth postulate (in some modern editions the eleventh axiom) of Euclid reads, "And if a right line incident upon two right lines make the two interior angles on the same side less in sum than two right angles, then those two right lines will meet on the side on which the angles are less than two right angles if produced to infinity." This proposition being much more complicated than any other assumed by Euclid without proof, a great number of attempts were made by mathematicians to demonstrate it. Finally, it was conclusively shown, as Gauss expressed it, that we have no reason to believe that the celebrated postulate is more than approximately true. There are thus three possible systems of geometry, the Euclidean and two non-Euclidean systems, according as it is assumed that there can be drawn through any given point, parallel to any given line, only one line, two real lines, or two imaginary lines.—**Zodiacal parallel**, in *astron.*, the situation of two planets at the same distance from the equator.

Some authors restrict the term to the episternum of the metathorax; others to the episterna of both the mesothorax and the metathorax; and many modern coleopterists use it in the place of parapleurum. Also parapleuron.

One of the unjointed lateral locomotor processes or series of foot-stumps, foot-tubercles, or rudimentary limbs of many worms, as annelids. Parapodia exhibit the greatest diversity in the extent to which they are developed at the sides of the successive segments of annelida, and also in their own sizes and shapes; and each parapodium—that is, the right or left foot-stump of any one segment—may be divisible into a dorsal and a ventral part, the former of which is a notopodium, the latter a neuropodium. The term is generally used in the plural, referring either to the right and left parapodia of any one segment or to the series of successive parapodia. The processes are so called because they are lateral in position, projecting from the sides of the worm. Those anterior ones which lie near the mouth are sometimes specially modified in size, shape, or direction, suggesting the foot-jaws of arthropoda. See cuts under prestomium, zygidium, and clytrium.

B. Jonson, *Volpone*, v. 4.

Specifically—2. (a) In *zool.*, an animal that lives in or on and at the expense of another animal called technically the *host*; also, by extension, an animal which lives on or with, but not at the expense of, its host: in the latter sense, more precisely designated *inquiline* or *commensal* (see these words). There is scarcely any animal that may not or does not serve as the host of parasites, and some parasites are themselves the hosts of other parasites. (See *hyperparasite*.) Parasites form no technical group of animals, since representatives of almost any class or order, from protozoans to vertebrates, may be parasitic. Most of the leading divisions of animals, however, include some members, whether genera, families, orders, or even classes, whose habit is extensively or exclusively parasitic. Thus, among protozoans, the *Gregarinae* are parasites. Among worms, many families, some orders, or even classes, are entirely parasitic, furnishing the most formidable and fre-

quent parasites of man and domestic animals. Very many of the lower crustaceans are parasitic, especially upon fishes, mollusks, etc., and upon one another; while some of the highest crustaceans are modified parasites, or commensals, as the little crabs that live in oyster-shells. Among arachnidans, the whole class or order of acarids or mites is essentially parasitic, though including many forms which lead an independent life. Insects furnish many of the parasites, especially of terrestrial animals, as vertebrates, and some are parasites of other insects. One order of insects, the *Acodura* or lice, is thoroughly parasitic, and other orders furnish parasitic families or genera. Insects and crustaceans both belong to the phylum *Arthropoda*, and it may be said that as a rule insects furnish the arthropod parasites of land-animals, and crustaceans those of water-animals, or terrestrial and aquatic "lice" respectively. Few mollusks are parasitic, but *Entoconcha mirabilis*, a gastropod found in holothurians, is an example. Very few vertebrates are parasites, but hags (*Myxine*) bore into fishes, fishes of the genus *Fierasfer* crawl into the intestines of holothurians, and some other fishes exhibit a kind of parasitism. Parasites not constituting any natural division of animals, it follows that, as such, they are not naturally divisible into zoological groups. They are, however, conveniently called *entoparasites* or *ectoparasites*, according as they live in or on their hosts, or *Entozoa* and *Epizoa*, upon the same grounds. According to the extent or degree of their parasitism, they are also known as *parasites proper* and *commensals* or *inquilines* (see above). Among the most remarkable parasites are the males of some species which have their own females as hosts, as among cirripeds. Such males are known as *complemental males*, one or more of which are carried about by the female in her vulva, they being of insignificant size and to all intents and purposes mere male parts of her. The above-mentioned parasites are exclusive of all those many animals which are parasitic upon plants, as gall-insects and the like; and also of those birds which are parasitic to the extent of laying their eggs in other birds' nests, requiring their progeny to be hatched and brought up by foster-parents, as cuckoos and cowbirds. See cuts under *Cecropia*, *Antonieus*, *Epizoa*, *Platygyalla*, and *Stylax*. (b) Particularly, an insect which lives either upon or within another insect during its earlier stages, eating and usually destroying its host. Such parasites belong mainly to the *Hymenoptera* and to the *Diptera*, but there are a few coleopters and lepidopters to which the name may be applied. See cut under *Antigaster*. (c) In *bot.*, a plant which grows upon another plant or upon an animal, and feeds upon its juices. See *parasitic*, and cut under *Cercospora*.

Fungi have long been divided into two main sections founded on their nutritive adaptation. Those which constitute the first category feed on living organisms, whether plants or animals, and are termed *parasites*.

3. In *teratol.* See *autosite*.—**Autocicous parasite**, in *bot.*, an organism which goes through the whole course of its development on a single host.—**Autogenous parasite**, in *bot.*, same as *autocicous parasite*.—**Facultative parasite**. See *facultative*.—**Heterocicous parasite**, in *bot.*, same as *metocicous parasite*.—**Metocicous parasite**, in *bot.*, an organism which passes through the different stages of its development on widely different hosts, as some of the *Uredineae*.—**Metogenous parasite**, in *bot.*, same as *metocicous parasite*.—**Obligate parasite**, in *bot.*, an organism to which a parasitic life is indispensable for the full attainment of its development.—**Syn. I. Parasite**, *Sycophant*. The object of the *sycophant* is to ingratiate himself with one who is wealthy or powerful, and his means are especially servility and flattery. The *parasite* gets a maintenance or a more comfortable maintenance by living upon one who is richer; there is no suggestion as to the means employed, but the word is contemptuous as implying a relation of degradation. The derivational idea of *sycophant* is now quite lost; the secondary use of *parasite* in connection with plant and animal life now affects the original sense of the relation of human beings.

parasitic (par-a-sit'ik), *a.* [= *F. parasiticus* = *Sp. Pg. parasitico* = *It. parasitico*, < *L. parasiticus*, < *Gr. παρασίτικός*, parasitic, < *παρασίτης*, a parasite: see *parasite*.] 1. Thus, members of the genus *Epeolus* (of which *E. mercator* is an example) live in the nests of *Colletes*; of *Colletes*, in the cells of *Megachile*; of *Megachile*, in the cells of *Anthophora*; and of *Stelis*, with *Osmia*.—**Parasitic birds**, those birds which lay their eggs in the nests of other birds, as the Old World cuckoos and the New World cowbirds.—**Parasitic currents**. Same as *Foucault currents*.

Electric Rev. (Eng.), XXVI. 118.

Parasitic plants, those plants which grow upon the living parts of other plants, from whose juices they derive their nutriment, a circumstance by which they are immediately distinguished from *false parasites*, or *epiphytes*, which merely fix or support themselves upon other plants without deriving food from them. The mistletoe is a familiar example of a true parasite. Parasitic plants are very numerous, and belong to various divisions of the vegetable kingdom. See parasitism of fungi upon algae, under *Lichenes*; of fungi upon phanerogams, under *hosts*, and *heterocism*. See also *obligate parasite* (under *parasite*), *facultative parasite* and *facultative saprophyte* (under *facultative*).—**Parasitic twin**, in *teratol.* See *autosite*.

II. a. Parasitoidal; destructive to parasites.
parasitism (par'a-si-tizm), *n.* [= *F. parasitisme* = *Pg. parasitismo*; as *parasite* + *-ism*.] 1. A habitual living on or at the expense of another; parasitic condition, tendency, or habits; a state of dependency on the favor or good offices of another.

Specifically—2. In *zool.* and *bot.*, the vital relation which a parasite bears to its host; parasitic infestation. It is a remarkable fact in biology that parasitism infallibly entails retrograde metamorphosis, degeneration, or degradation of the type of structure which would be normal to the organism were it not parasitic. Thus, parasitic members of groups of insects which are normally winged lose their wings and suffer other modifications of structure. Among crustaceans parasitism results in the most grotesque shapes imaginable—mere caricatures, as it were. Mouth-parts, limbs, and other appendages are usually reduced to mere suckers, hooks, or other devices for holding to the host, or even to processes like rootlets of plants, deeply penetrating the substance of the host. In many parasites of comparatively high organization, as tapeworms, there is no proper digestive system, nor any alimentary canal, the creature being nourished by soaking in the juices of its host. Hence, morphological characters resulting from parasitic adaptation are essentially degradational, or vestigial, and have not, or should not be considered to have, the same classificatory or taxonomic significance which attaches to a corresponding amount of morphological difference in organisms which lead independent existences.

parasitize (par'a-si-tiz), *v. t.*: pret. and pp. *parasitized*, ppr. *parasitizing*. [*parasite* + *-ize*.] In *zool.*, to infest or make a host of (another animal), as a parasite.

Jour. Philol.*, v. 221.

It is the increasing intensity of light in the morning which induces the waking of the leaves, and the decreasing intensity in the evening which induces the closing or nocturnal position of the leaves, whereas in the heliotropic curving of motile organs it is the constant influence of light which effects the turning. As employed by other vegetable physiologists, the word implies also the retarding influence of light upon growing organs, in distinction from the *photonic* or stimulating effect upon leaves. That is, in leaves exposed for a protracted period to darkness the growth is arrested, but they have the power of growth restored on exposure to light, whereas all growing organs grow more rapidly in darkness than in light, this effect of light in retarding growth being termed the *paratonic effect*.

The power of movement, whether spontaneous or *paratonic*, may be temporarily suspended by certain external conditions. *Bessey*, *Botany*, p. 198.

= *Syn. Pardon, Forgive*. These words are often synonymous. Strictly, *pardon* expresses the act of an official or a superior, remitting all or the remainder of the punishment that belongs to an offense: as, the queen or the governor pardons a convict before the expiration of his sentence. *Forgive* refers especially to the feelings; it means that one not only resolves to overlook the offense and re-establishes amicable relations with the offender, but gives up all ill feeling against him. See *pardon*, *n.*

In *law*, a free remission of the legal consequences of guilt or of some part of them; an act of grace proceeding from the power charged with the execution of the laws, which exempts the individual on whom it is bestowed from the punishment the law prescribes for a crime he has committed. *Marshall*. Mere mitigation of

punishment is not pardon. *Pardon* is sometimes used in the more general sense which includes *amnesty*. In Great Britain the pardoning of offenses against the crown or the people rests with the crown, except in certain specified cases. Pardon is granted under the great seal or by warrant under the sign manual, counter-signed by one of the principal secretaries of state, or by act of Parliament. Offenders against the laws of the United States may be pardoned by the President, except in cases of impeachment. In nearly all the States, persons convicted of crimes under the State laws, except in cases of treason and impeachment, may be pardoned by the governor, the governor and council, or the governor and board of pardons.

To beg, crave, or ask one's pardon, to ask one's forgiveness: a phrase corresponding in use to *pardon me* (which see, under *pardon*, *r.*) = *Syn. Pardon, Absolution, Remission, Amnesty*. All these words represent a complete work with reference to the offense, so that it becomes as though it had not been committed. *Pardon* is the general word (see comparison under *pardon*, *r. l.*) *Absolution* is now strictly an ecclesiastical word, as defined. *Remission* is, by derivation, a letting go, a sending away; "remission of sins" is a frequent Biblical expression; outside of Biblical language, we speak chiefly of the *remission* of penalty; as, the *remission* of a fine or of part of a term of imprisonment. *Amnesty* is strictly a political word, as defined, covering a general pardon of persons, named or unnamed, who have become exposed to penalty by offenses against the state or the sovereign. We speak of *pardon* of the offense or the person; *absolution* of the person from the offense; *remission* of sin or of penalty for the person; *amnesty* to all concerned in the insurrection.

Such persons would be within the general pardoning power, and also the special provision for *pardon* and *amnesty* contained in this act. *Lincoln*, in *Raymond*, p. 202.

The figurative uses of these two words are limited. *Share* or *share off* still seems figurative when not implying the use of a razor, and is controlled in its meaning by that original

sense; hence it is always limited to dressing off the surface.

(c) The general substance of the interior of the parenchymatous worms.—2. In *bot.*, the fundamental cellular tissue of plants; contradistinguished from *prosenchyma*, or fibrovascular tissue. It is the soft thin-walled tissue, with approximately isodiametric cells, which composes the soft pulp of leaves between the network of veins, the pulp of fruits, etc. In a dicotyledonous stem it forms the outer bark, the pith, and the medullary rays; in monocotyledons it is the common mass, of loose texture, through which the definite fibrovascular bundles are distributed. While the ordinary or typical shape of the cells is polyhedral or spheroidal, there are numerous modifications, all of which formerly received special designations, but only a few principal types are now distinguished by names. Spongy parenchyma is tissue in which the cells are loosely aggregated and have large intercellular spaces. Elongated parenchyma-cells are more compactly combined than short ones, and in the upper side of leaves have received the significant name of *palisade-cells*. Flattened parenchyma-cells are seen in the medullary rays of dicotyledons. Collenchyma, sclerotic and suberosus parenchymas, trichomes, etc., are further modifications. See *collenchyma, palisade-cell, sclerotic, suberosus, trichome*, and cuts under *cellular, cystolith, and tissue*.
